The implications for economic efficiency are considered when tax-subsidy combinations for industrial development and pollution control are combined. Recent research has stressed the symmetry between tax and subsidy means of controlling external diseconomies in water quality management when income distribution and administrative asymmetries are ignored. In the long run the imposition of a tax on polluters or a subsidy to firms complying with anti-pollution measures result in differences in the size of external effects and economic efficiency. This is due to the difference in the placement of the cost burden either on firms or the community as a whole. When the burden is placed on firms, firms may shift location and hence this results in loss of employment to the community. To alleviate this problem, the authors suggest the cost of pollution be shared equally by the firm and community with a combination tax and subsidy scheme. Furthermore, greater coordination among communities on industrial development would result in more acceptable pollution levels on a regional basis. (Siegenthaler-Rutgers)

A THREE STEP APPROACH TO POLLUTION REVERSAL,
Oregon Univ., Eugene.
Roman R. Andrus.
University of Washington Business Review, Vol 29, No 4, p 37-43, Summer 1970.

Descriptors: *Pollution abatement, Effluent charge, Economic efficiency, Cost-benefit analysis, Waste water disposal.
Identifiers: *Externalities, Social disutility tax, Subsidy.

An approach to pollution control is proposed utilizing a three step process aimed at controlling the three basic forms of pollutants. The author defines the basic forms of pollutants as the production and distribution of by-products by industry, the by-products of the consumption process and space allocation failures. First, standards are set for environmental quality to deal with problems of solid and waste water disposal. Secondly, pollution control requires that firms or individuals bear the liability for being the source of pollutants. Third, the author suggests that initially incentives must be provided by the government in terms of subsidies or tax relief to encourage firms to comply with pollution control objectives. As a second step, effluent charges should be levied in increasing amounts on firms who continue to engage in polluting activities. (Siegenthaler-Rutgers)

PROCEEDINGS, GREAT LAKES WATER RESOURCES CONFERENCE.

Toronto, Canada, the Hydro-Electric Power Commission of Ontario, June 24-26, 1968. 489 p.

Descriptors: *Great Lakes, *Water use, *Water resources planning, *Water quality, *Flow regulation, Multiple use, Navigation, Recreation, Pollution, R and D, Costs, Technology, Government, Lakes, Rivers, Optimization.
Identifiers: *Economic development, Shore property, Cost sharing, Canada.

This book is a compilation of several papers given at the Great Lakes Water Resources Conference, which was gathered to present and disseminate information bearing on the management and administration of various aspects of the Great Lakes resource. Topics presented include multiple uses of the Lakes, regulation of the lakes, and water quality in the lakes. The historical development of these topics is surveyed, as are present problems in the various areas. The water resource is viewed from both Canadian and United States viewpoints, particularly in its impact on the regional economies of the areas in the Great Lakes drainage basin. The future potential development of the Great Lakes as a resource is projected; and various development plans are proposed. A large segment of the book is concerned with the problem of pollution and methods to remedy and/or prevent such destruction in future development plans, as suggested by professionals in all appropriate areas. HYDRO-ELECTRIC POWER DEVELOPMENT ON THE GREAT LAKES SYSTEM,
Hydro-Electric Power Commission of Ontario, Toronto.
H. A. Smith.
In: Great Lakes Water Resources Conference, Toronto, The Hydro-Electric Commission of Ontario, p 49-88, 1968.

Descriptors: *Hydro-electric power, *Great Lakes Region, *Flow regulation, *Lakes, *Water

resource development, Navigation, Water quality, Thermal pollution, Water supply, Recreation.
Identifiers: *International treaty, Economic development, Electric energy, Pumped storage plants.

A defense is presented of the need for additional hydro-electric power development on the Great Lakes system, proposing that such development is warranted by the expected benefits to the community and the constantly changing magnitude of the needs of the community for water resource exploitation. The past hydro-electric power development of the Great Lakes region as representative of the field. A brief description is given of the benefits of such development, treating such economic aspects as power development for community use, lake regulation, and navigation channels, in addition to the creation of parks and recreation areas and the enhancement of science spectacles. Additional electric energy could be produced by means of additional international lake regulation measures and/or by the construction of additional plant. Such economic developments could be achieved, the author suggests, by exploiting some of the characteristics of the Great Lakes system. (See also W71-07565) (Murphy-Rutgers)
W71-07566

HISTORY OF THE DEVELOPMENT OF USE OF THE GREAT LAKES AND PRESENT PROBLEMS,
Army Engineer Div., Chicago, Ill.
C. F. Macnist, and H. F. Lawhead.
In: Great Lakes Water Resources Conference, Toronto, the Hydro Electric Power Commission of Toronto, p 1-48, 1968.

Descriptors: *Great Lakes Region, *Water resource development, Population, Water supply, Economic analysis, Rivers, Lakes, Hydrology, Watershed, Transportation, Conservation, Recreation, Geography.
Identifiers: *Multiple-use resource, *Interdisciplinary approach, Power development.

Various aspects of the Great Lakes basin are considered, such as the resources of abundant water supply, the natural regulating influences of the lakes' surfaces, the minerals of the basin and nearby areas, and the surrounding arable and timbered regions. A brief history of the area's rapid development introduces the article, citing the growing population which will eventually call for further development and utilization of the Great Lakes resource by both the United States and Canada. The geography, geology, climatology, and hydrology of the Lakes and their drainage basin are described, as well as the economic ramifications of the area's development in commercial fishing, population growth, water transportation, mining, manufacturing, agriculture, power development, water supply, conservation and recreation. The end result of this discussion is conclusive indication that an interdisciplinary approach of both engineering and research must be coupled with a high degree of international coordination and cooperation to insure the optimal development of the many aspects of the Great Lakes water resources. COMMERCIAL NAVIGATION ON THE GREAT LAKES,
St. Lawrence Seaway Authority.
W. R. Mackay.
In: Great Lakes Water Resources Conference, Toronto, The Hydro-Electric Commission of Ontario, p 89-114, 1968.

Descriptors: *Navigation, *Great Lakes, St. Lawrence River, *Economic analysis, *Canals, Technology, Transportation, Water supply, Drainage, Shipping.
Identifiers: *Commercial navigation, *Economic growth, *Economic development, Export trade, Railroads, Potash, Grain, Coal, Iron ore, Industrial development.

A history is presented of the growth of commercial navigation in the Great Lakes and St. Lawrence system from its beginning to the present. It indicates the relationship between the canal developments and the economic development and growth of the system as a whole. The historical economies of commercial navigation are juxtaposed with the historically non-competitive railroad technology which presented a far costlier alternative. Future growth possibilities for the Great Lakes system are proposed to exist in the potential development of Saskatchewan potash deposits, especially if combined with the increasing grain, coal, and iron ore traffic and the expansion of overseas trade. The author emphasizes that the value of commercial shipping to both the Canadian and American economies amounts to astronomical figures which influence both immediate and long-range export trade and the economic growth and development of both nations. CONFLICTS OF RECREATION AND OTHER USES OF THE GREAT LAKES,
Department of the Interior, Washington, D.C.
S. A. Cain.
In: Great Lakes Water Resources Conference, Toronto, Hydro-Electric Power Commission of Ontario, p 121-144, 1968.

Descriptors: *Great Lakes Region, *Fishing, *Costs, Water pollution, Planning, Watershed, Ecosystem, Streams, Lakes, Water quality, Recreation, Social aspects.
Identifiers: *Commercial fishing, *Alewife, *Cost accounting, *Total planning, Market conditions, Lamprey, Land use control.

The burden that pollution of the Great Lakes has imposed on the natural processes of renewal is considered. Particular attention is given to the conflicts of water uses in light of the alewife explosion. The conflict in this case was largely between the large profits of the alewife to the commercial fishing industry, and the dead alewife pollution of the beaches. The need for environmental awareness and the use of cost accounting which considers the ecosystem rather than only the per unit profit is called for to eliminate the high costs of water development for uses which ignore natural processes. To further this goal, the author suggests a total planning program which incorporates the full cooperation of private enterprise and government at all levels. This would enable all segments of the society to meet legitimate aspirations which would necessarily encompass a quality environment in addition to a healthy economy. NEW REQUIREMENTS IN WATER RESOURCES PLANNING ON THE GREAT LAKES,
Great Lakes Basin Commission, Ann Arbor, Mich.
J. W. MacLaren, and R. F. Clevenger.
In: Great Lakes Water Resources Conference, Toronto, The Hydro-Electric Power Commission of Ontario, p 361-391, 1968.

Descriptors: *Great Lakes, *Water resources development, *Optimization, Water supply, Navigation, Hydropower, Irrigation, Agriculture, Fisheries, Recreation, Erosion, Watershed, Pollution, R and D, Government, Population, Technology.
Identifiers: *International Joint Commission, *Economic development, *Great Lakes Basin Commission, Power development.

A survey is presented of current conditions on the Great Lakes, stressing the multiple uses of the resource and the inter-effect of the various uses. The type of action needed for planning that permits optimum development of the resources on both the Canadian and United States sides of the border is discussed, particularly in light of the economic value of the resource to both economies. There is a discussion of such problems as water supply, water quality, waste disposal, navigation, power development, agricultural irrigation, fisheries, and recreation. A comprehensive plan for the staged development of the water resources of the Great Lakes is presented which attempts to determine the importance of the resource in economic development, the need for government support, the future requirements of the resource, and balanced utilization of available resources. Various suggestions are proposed for the implementation of such a plan, referring specifically to the Great Lakes Basin Commission and the International Joint Commission as monitoring agencies. (See also W71-07565) (Murphy-Rutgers)
W71-07574

ORGANIZATION AND PLANNING OF WATER QUALITY CONTROL,
Ontario Water Resources Commission, Toronto.
W. A. Steggles.
In: Great Lakes Water Resources Conference, Toronto, the Hydro-Electric Power Commission of Ontario, p 449-470, 1968.

Descriptors: *Water quality, *Great Lakes, *Water management, Government, Pollution, Drainage basin, Rivers, Sewers, Transportation, Population, Chloride, Waste treatment, Streams, Erosion, Canals.
Identifiers: *Quality control policy, *Economic incentives, Gross products.

The growing pollution problems of the Great Lakes are indicated; such problems are controllable by suitable planning, regulation and other procedures. This end could best be achieved by coupling water quality goals with economic incentives to reduce pollutants at the source. Greatly improved water pollution control technology is needed as the technology, economy, and standard of living increase in the Great Lakes area, as shown by such examples as gross products, human and animal populations, seaway and canal traffic, chloride content of lakes, and nutrients in Lake Erie. The three major areas of concern for appropriate water management are proposed as development of plans for optimal water use, study of tolerance for waste water, and a watch to detect unusual waste spills and overloads from treatment facilities. Various water quality objectives and standards are surveyed from both the Canadian and US viewpoints, and suggestions are presented for implementation of the new policies. (See also W71-07565) (Murphy-Rutgers)

SUGAR CANE IRRIGATION: A CASE STUDY IN CAPITAL BUDGETING,
McKinsey and Co., Inc., San Francisco, Calif.
Robert R. Champion, and George R. Glaser.
Management Science, Vol 13, No 12, B-781-B796, Aug 1967.

Descriptors: *Irrigation systems, Economic efficiency, Operating costs, Water supply, Operation research, Interest rate.
Identifiers: *Capital budgeting, Opportunity cost, Sensitivity analysis, Net Present Value, Payback, Cash flow.

This irrigation economics study is designed to recommend, on an agronomic and economic basis, a program for investing large amounts of capital in automatic and semiautomatic irrigation systems. Although this is a capital budgeting problem, the application of investment techniques was complicated by a wide range of climatic, topographic and agronomic conditions. The author considered

nomogeneous fields as blocks in order to reduce he number of investment alternatives. Then alter- native irrigation systems were evaluated on a block-by-block basis using an investment analysis model and sensitivity tests. For ranking the returns of each alternative, the author used criteria of Net Present Value years to payback and source of water contribution. The analysis then proceeded with the estimates of costs and savings attributable to each alternative. (Siegenthaler-Rutgers)

EQUITY AND EFFICIENCY IN PUBLIC GOODS SUPPLY,
Dalhousie Univ., Halifax (Nova Scotia).
John G. Head.
Public Finance, Vol XXV, No 1, p 24-37, Nov 1970.

Descriptors: *Economic efficiency, Welfare economics, Resource allocation, Taxes.
Identifiers: *Equity, Social welfare function, Income redistribution, Public goods, Lump sum tax, Pareto criterion.

This paper considers Musgrave's treatment of the relationship between equity and efficiency in public goods supply. The two step framework for welfare maximization assumes an ideal income distribution and on the basis of this income distribution, public goods would be provided in accordance with individual preferences using a voluntary system of tax-prices. Musgrave finds that there is an indeterminary in public goods supply. The author suggests that this indeterminary does not exist and that Musgrave's conclusion as derived from the assumption that an initial ideal income distribution guarantees that the final distribution of welfare after public goods are supplied is also ideal. However, a formal solution to the problem of public goods supply is possible only if the ideal income distribution is defined in terms of the welfare maximum achieved after public goods have been supplied. The author finds that Musgrave's approach is equivalent to the social welfare function method but is more conducive to operationalization. This paper is relevant to water research concerned with the role equity and efficiency criteria in policy making. (Siegenthaler-Rutgers)
W71-07583

ON THE APPLICATION OF CARDINAL UTILITY THEORY TO ENGINEERING ECONOMIC ANALYSIS,
University of Southern California, Los Angeles.
Gerald Fleischer, and Robert H. Cremer.
The Engineering Economist, Vol 16, No 2, p 117-130, Winter 1971.

Descriptors: *Economic evaluation, Decision making, Cost-benefit analysis, Risk, Probability, Interest rate, Marginal utility, Discount rate.
Identifiers: *Cardinal utility, Cash flow, Rate of return, Present worth.

This paper considers the integration of cardinal utility concepts into the engineering economy methods of analysis and evaluation that are based on the manipulation of cash flow. The traditional concern with monetary quantities in the cash flow method is an oversimplication of relative project worth because the net utility of the project to the investors is neglected. The author outlines several of the key problems associated with establishing a specific utility function and suggests procedures for dealing with these difficulties when they occur in the public and private sectors. Several research questions are pointed out as needing further study; however, the author concludes at present a sufficient state of refinement does exist to include elements of utility theory into a conceptual framework for limited operationalism. This article is relevant to water research concerned with project evaluation and decision making. (Siegenthaler-Rutgers)
W71-07584

THE CONSIDERATION OF RISK AND UNCERTAINTY IN CAPITAL INVESTMENT ANALYSIS,
North Carolina State Univ., Raleigh.
J. R. Canada.
Management International, Vol 7, No 6, p 47-55, Dec 1967.

Descriptors: *Risk, Decision making, Economic evaluation, Budgeting, Mathematical model.
Identifiers: *Capital budgeting, Statistical decision theory, Risk discounting, Sensitivity study, Decision tree, Probabilistic monetary model.

This article surveys a wide variety of approaches or procedures that can be used to consider risk and uncertainty in capital budgeting analysis. The approaches are categorized into two groups according to the degree of sophistication involved. The basic traditional approaches discussed are assumed certainty, conservative adjusting, risk discounting, and sensitivity study. The author finds these related approaches to be quite limited in dealing with the consideration of risk. More advanced approaches such as the probabilities monetary, method, the decision tree, expected utility, and statistical decision theory are found to be more effective. The author concludes that these methods need further testing but do serve as a valuable supplement to administrative judgment. This article is relevant to water research concerned with project evaluation and water investment analysis. (Siegenthaler-Rutgers)
W71-07585

AN ANALYSIS OF APPLICATIONS OF THE UTILITY CONCEPT,
San Fernando Valley State Coll., Northridge, Calif.
Ernest H. Weinwurm.
The Engineering Economist, Vol 16, No 2, p 131-139, Winter 1971.

Descriptors: *Decision making, Risk, Economic evaluation, Mathematical model.
Identifiers: *Utility function, Opportunity cost, Planning-programming-budgeting, Subjective probability, Capital investment.

This paper considers the application of risk analysis and utility or preference theory to decision making models. The author first considers the conversion of qualitative data obtained from subjective behavior of managers to quanitative data. Then, the concept of risk analysis and utility theory is outlined along with a number of applications. The final section of the paper focuses on a recent study concerned with the explicit consideration of uncertainty in capital investment analysis. The approach is largely based on the normative decision model that combines subjective probability with the Von Neumann and Morgenstern utility theory. The author claims that two important improvements in the corporate decision process could result from a risk policy. First, it would help to avoid opportunity costs from rejecting prematurely risky projects and second it permits interpretation of risk information while satisfying the goal of maximizing expected utility. This article is relevant to budgeting and capital studies concerned with incorporating risk into water investment decision making. (Siegenthaler-Rutgers)
W71-07586

THE SYMMETRY APPROACH TO COMMITTEE DECISIONS: AN EMPIRICAL STUDY OF A LOCAL GOVERNMENT BUDGET COMMITTEE,
Wayne State Univ., Detroit, Mich.
Karl W. Roskamp, and Gordon C. McMelkin.
Zeitschrift fur die Gesamte Staats Wissenschaft, 126, Band I, p 75-96, Jan 1970.

Descriptors: *Decision-making, Economic evaluation, Uncertainty, Budget constraint, Resource constraint, Simulation.
Identifiers: *Symmetry of loss, Cardinal utility, Social utility function, Linear transformation.

This paper is concerned with the construction of operational decision models for the simulation of committee decisions. The authors present an empirical test of a modified version of the symmetry of loss approach using data from a local government's budget committee. This method permits one to derive from given individual cardinal utility functions a social utility function or committee utility function. Individual committee members were asked about their preferences with respect to budget size and composition and from these input, hypothetical budgets were generated using the symmetry of loss method. Comparison of the generated budget to the actual budgets revealed a high level of accuracy. The authors conclude that the symmetry approach should generate expenditure distributions close to actual results if the budget constraint is known or carefully estimated and if strategies and tradeoffs are considered. This paper is relevant to water research concerned with the decision making process and the expenditure implications of water investment decisions. (Siegenthaler-Rutgers)
W71-07588

SELECTING REGIONAL INFORMATION FOR GOVERNMENT PLANNING AND DECISION-MAKING,
California Univ., Los Angeles.
Werner A. Hirsch, and Sidney Sonenblum.
New York, Praeger, 1970. 198 p.

Descriptors: *Decision-making, Regional analysis, Economic evaluation, Cost-benefit analysis, Program budgeting, Economic efficiency, Resource allocation.
Identifiers: *Subnational information design, Social welfare, Horizon scanning.

This book is a revised version of one prepared for a Conference of the Committee on Regional Accounts of the Resources for the Future held in 1968. The purpose of the study is to develop a Subnational Information Design (SID) that will facilitate improved decisions at the state and national level. The information design is aimed at facilitating two kinds of decisions: horizon scanning decisions and preferred solution selection decisions. To assist the decision maker in horizon scanning decision-making, the information system can perfect alternative futures and also highlight the potential areas of concern. The analytical tool for preferred program selection is benefit-cost analysis within a program budgeting framework. The information system should be designed to aid in the development of a program budget and in the calculation of costs and benefits. The authors also describe the construction, mechanics, and alternative uses of an information retrieval system by decision-makers. This book is relevant to water planners concerned with the role of information systems in policy and program decisions. (Siegenthaler-Rutgers)
W71-07589

ON THE ASSESSMENT OF RISK,
Pennsylvania Univ., Philadelphia.
Marshall E. Blume.
The Journal of Finance, Vol XXVI, No 1, p 1-10, Mar 1971.

Descriptors: *Risk, Economic evaluation, Forecasting, Regression analysis, Covariance, Correlation.
Identifiers: *Beta coefficient, Portfolio approach, Bias, Capital budgeting.

This paper examines the statistical properties over time of one measure of risk, the coefficient of nondiversifiable risk (or the beta coefficient in investment analysis). The author defines the beta coefficient and presents a justification of its use as a measure of risk based on the empirical validity of the market model. After discussing the sample and its basic properties, the author examines the stationarity of this beta coefficient over time and then proposes a method of obtaining improved assessments of this measure of risk. The results of the em-

pirical analysis show a tendency for the estimated values of the risk measures to regress toward the mean. The author uses historical rates of regression for Beta to adjust the assessments for future risk coefficients and finds an improvement in the accuracy of the measurement of risk. This article is relevant for water studies concerned with the selection of alternative risky water investment projects. (Siegenthaler-Rutgers)
W71-07590

PORTFOLIO ANALYSIS, STOCK VALUATION AND CAPITAL BUDGETING DECISION RULES FOR RISKY PROJECTS,
New York Univ., N.Y.
Richard C. Stapleton.
The Journal of Finance, Vol XXVI, No 1, p 95-117, Mar 1971.

Descriptors: *Decision making, *Risk, Economic evaluation, Interest rate, Regression analysis, Economic efficiency.
Identifiers: *Capital budgeting, Net discounted value, Cash flow, Portfolio theory, Rate of return.

This paper derives capital budgeting decision rules based on stock value models derived within a portfolio framework when cash flows resulting from the acceptance of projects are risky. The stock value theory is used to derive optimal decision rules for the evaluation of individual capital projects. The decision rules are in terms of a project's discounted value and rate of return. Three different approaches to project evaluation are considered. The first method uses the probability distribution of the net discounted value (NDV) or the rate of return (RR) to derive the certainty equivalent (NDV) or the certainty equivalent (RR). The second method derives the same certainty equivalent values by computing the certainty equivalent cash flows of the project. The third approach uses the expected value of the cash flows of the projects and discounts these flows at a risk-adjusted discount rate to compute the (NDV). All three approaches yield the same accept-reject decision rules. This article is relevant for water resource studies concerned with capital budgeting and project evaluation. (Siegenthaler-Rutgers)
W71-07591

THE APPLICATION OF SYSTEMS ANALYSIS TO GOVERNMENT OPERATIONS,
George Washington Univ., Washington, D.C.
Guy Black.
New York, Praeger, 1969. 186 p.

Descriptors: *Systems analysis, Cost-benefit analysis, Risk, Marginal cost, Optimization, Linear programming, Input-output analysis, Discount rate.
Identifiers: *Cost effectiveness, Feedback theory, Sensitivity analysis, Present value.

This book considers the relation between the tools of the systems approach and the structure of systems concepts as related to government operations. Three major phases of the systems approach are discussed: systems analysis, systems engineering and systems management. Systems analysis establishes optimum system characteristics, analyzes interactions and studies the characteristics of the subsystems. The author uses cost-benefit analysis for identifying optimal system designs with the benefit function representing social benefits adjusted for risk. The relationship and distinctions between systems concept and Planning-Programming-Budgeting System are made. The National Park Service is used to illustrate how systems analysis takes account of externalities for both cost and benefit. This book is relevant to water administrators and researchers concerned with program analysis in terms of cost effectiveness. (Siegenthaler-Rutgers)
W71-07592

DECISION-MAKING ON TAXATION AND EXPENDITURES,
National Bureau of Economic Research, New York.
Charles E. Lindblom.
In: Public Budgeting and Finance, Itasca, F. E. Peacock Publishers, p 287-309, 1968.

Descriptors: *Decision-making, *Taxes, *Government, *Resource allocation, Cost-benefit analysis, Budgets, Costs, Minimization, Economic analysis, Welfare economics.
Identifiers: *Government expenditures, Normative economics, Means-end calculations, Overview, Fiscal policy.

This article presents an investigation for workable norms in decision-making processes. Two types of norms are dealt with, those for taxes and those for designers of decision-making machinery. The ultimate aim of the project presented is to make possible the eventual formulation of more workable standards for government tax and expenditure decisions through a refined aspect of normative economics. Characteristics of contemporary policy-making in government expenditures and taxation are first presented, dealing with budgetary difficulties and allocation of scarce resources. Norms such as objective clarification, deliberate choice, cost minimization, reasonable cooperation, and unified decision-making for interdependent events are collated from the policy presentation. The author then cites the discrepancy between these norms and actual practices, and suggests several possible solutions to these difficulties, including incremental decision-making, the bottleneck principle of scarce resource allocation, and coordination through partisan mutual adjustment. These principles, along with the analysis of the implications for the norms and principles discussed are relevant to the planning process of direct and indirect tax based water investments. (Murphy-Rutgers)
W71-07593

BUDGETING AND DECISIONMAKING PROCESS,
Harvard Univ., Cambridge, Mass.
Arthur Smithies.
In: Public Budgeting and Finance, Itasca, F. E. Peacock Publishers, p 253-261, 1968.

Descriptors: *Decision-making, *Federal government, *Budgeting, Resource allocation, Taxes, Budgets, Planning, Uncertainty, Economic analysis.
Identifiers: Policy objectives, Programming, Budget execution, Estimates.

This article presents the relation of budgeting to the process of governmental decision-making. Almost all government decisions have budgetary implications in that they involve allocating scarce resources among alternative uses. One primary purpose of the author is to establish that the entire decision-making process is greatly improved if these choices of allocation are made both explicitly and deliberately. The other primary goal of the author is to present a comprehensive discussion of the decision-making process, particularly the budgetary aspect, from the viewpoint of the structure and procedure of a complicated organization, namely the Federal government. Principles of organization are presented that can easily be applied in analysis of the specific problem of the Federal budget. Difficulties such as uncertainty are dealt with, and suggestions for optimally effective planning are proposed. These suggestions are of interest to those in the water resource planning field relating to resource allocation. (Murphy-Rutgers)
W71-07594

REGIONAL ALLOCATION OF PUBLIC INVESTMENT,
Tokyo Univ. (Japan).
Noboru Sakashita.
In: The Regional Science Association Papers, Vol 19, p 161-182, 1967.

Descriptors: *Investment, *Regional analysis, *Economic efficiency, Model studies, Capital, Economic analysis, Social aspects, Income, Optimization, Jobs, Taxes, Time.
Identifiers: *Public investment, *Regional allocation, *Efficiency criterion, Growth patterns, *Multiregion economy, Economic variables, Externalities.

This article deals with the problems of allocation of public funds by central governments to promote regional social capital formation. Lack of efficiency in such investment is ascribed to lack of interregional industrial complementarity and the political problems of such economic allocations. Two models are proposed to evaluate the effect of regional allocation of public investment on the growth pattern of a multiregion economy. The models differ concerning the presumptions on the productivity of public investment. Three properties of the optimal solution to the regional allocation problem result from the development and explanation of the models. These properties hold that public investment is justified since it originates outside the market mechanism, that public investment should be concentrated where the change in the values of relevant parameters is minimal, and that the optimum growth plan may call for utilizing several kinds of public investment policies. This paper is relevant to the analysis of the effects of public water resource investments on a regional economies. (Murphy-Rutgers)
W71-07595

PUBLIC INVESTMENT, THE RATE OF RETURN, AND OPTIMAL FISCAL POLICY,
Resources for the Future, Inc., Washington, D.C.
Kenneth J. Arrow, and Mordecai Kurz.
Baltimore, The Johns Hopkins Press, 1970. 218 p.

Descriptors: *Economic efficiency, *Planning, *Water resource development, Taxes, Discount rate, Optimization, Rate of return, Government, Capital, Financing, Management, Risk, Investment, Returns to scale, Cost-benefit analysis.
Identifiers: *Intertemporal criteria, *Resource allocation, *Controllability, Growth theory.

This book is an effort to remedy the inadequacy of existing theory of intertemporal criteria for resource allocation. It attempts to derive criteria for such allocation from dynamic notions of efficiency and then relates them to the macroeconomic problems of stability and growth. The book achieves a formulation of the problem of public expenditure in the context of modern economic growth theory by tying the determination of the allocation of resources between public and private sectors to the goal of getting the economic system onto an efficient growth path. The theory of public expenditure is developed by presenting an exposition of modern growth theory, and then developing a new theory of 'controllability'. The latter theory explores the question of whether or not the instruments of general fiscal control are sufficient to bring about an optimal intertemporal allocation of resources in the presence of constraints imposed by private behavior. The question of 'controllability' as presented here is relevant to those involved in water resource development and planning. (Murphy-Rutgers)

LANNING FOR WATER IN AN URBAN AGE,
uy J. Kelnhofer.
aper delivered at Clemson University, 12 Feb 970. 12 p.

escriptors: *Planning, *Water resources, *Ur- anization, *Management, Land resources, Coor- ination, Water supply, Technology, Communica- on, Decision-making, Manpower, Professional ersonnel.
dentifiers: *Metropolitan water resource manage- ent, Urban age.

is pointed out that America is now in an urban ge and that all types of planning must reflect this ct. This is particularly true of water planning, here a transition from a rural to an urban orienta- on need to be made. A number of salient por- ems of this transition can be identified. (1) We ust find more responsive and more efficient eans of defining the interests of metropolitan reas in the water and related land resources serv- g their communities. (2) The problem of bringing gether, under one common mangement system, ll of the related functions of water in a etropolitan area is one which becomes more ur- ent as the demand on urban water supplies in- reasingly exceeds existing management capabili- es. (3) We must find ways to put our new nowledge to use more rapidly. (4) We must roduce larger numbers of trained resource plan- ers. (5) We must find ways to communicate with he man in the street and elected officials on all evels. (6) We must devise improved systems of ublic decision-making. (Davis-Chicago)

Identifiers: *Discriminant analysis, Community performance.

Few analyses have been made of the performance of communities engaged in water development projects within a free society. It is usually assumed that, once informed of the possible benefits, local citizens will quickly adopt proposed water development projects. In order to investigate this assumption an analysis of the differences in performance of local communities in achieving developmental goals was undertaken. The discriminant analysis technique utilized provides a method of classification of watersheds into groups representing fast to slow accomplishment of watershed development. It provides a test of significance of these groupings. It also provides classification coefficients to predict, based upon the performance of the original sample, the behavior of subsequent watersheds for which data on the same variables are available. Investigation of the classified watersheds according to type of sponsorship and pattern of relationships among certain variables or measures should help explain why some of the socio-economic variables affect rate of progress in watershed development. Recommendations as to type of sponsorship given certain relationships can then be advanced for future development projects. (Davis-Chicago)

SOME ASPECTS OF WATER PRICING IN NON-INDUSTRIAL COMMUNITIES,
Florida Univ., Gainesville. Dept. of Economics.
C. W. Fristoe, F. O. Goddard, and N. G. Keig.
Land Economics, Vol 47, No 1, p 87-92, Feb 1971. 4 ref, 1 fig.

Descriptors: *Rates, Municipal use, Sprinkler irrigation, Lawns, Cost allocation.

In attempting to discuss ways of dealing with the effect of lawn irrigation on water pricing and cost, the authors advocate water use restrictions in order for water utilities to pursue a policy of charging the users of a water service the full cost of supplying it. Since lawn sprinkling substantially raises the maximum day and peak-hour rates of water delivery as well as concentrating the highest levels of water consumption into one season, imposing restrictions on the use of water for lawn irrigation 'would best promote the public interest.' COST OF PUMPING IRRIGATION WATER IN ARIZONA: 1891 to 1967,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
Thomas Archer, and William E. Martin.
Water Resources Research, Feb 1971, Vol 7, No 1, p 23-31. 5 fig, 1 tab, 32 ref.

Descriptors: *Irrigation practices, Operating costs, Water rates, Cotton, *Arizona.
Identifiers: Pinal County (Ariz), Agricultural Experiment Station.

The historical record of the cost of pumping groundwater in Arizona is examined. Costs are presented in actual dollars and dollars adjusted by GNP implicit price deflators. Whereas pumping depths have been rising rapidly, costs per acre-foot per foot of lift have been falling, adjusted costs per acre-foot have been almost constant, and per acre costs and total farm costs relative to both total costs and total returns have fluctuated throughout the time period examined, sometimes being lower but often being higher than costs at the present time. (Holmes-Rutgers)

EFFLUENT CHARGES: A METHOD OF ENFORCING STREAM STANDARDS,
Maine Univ., Orono.
Orlando E. Delogu.
Maine Law Review, Vol 19, p 29-47, Jan 1967.

Descriptors: *Water pollution control, Water quality, Pollution abatement, Resource allocation, Sewer treatment facility, Water supply.
Identifiers: *Effluent charge, Stream standard, Externalities, User charge, Transfer payment.

The use of effluent charges are considered a means of achieving stream standards defined by the state and Federal government. The effluent charge system would shift the cost burden of the presently employed means of waste disposal from the state and downstream users to the economic unit creating the waste product. The effluent charge system corrects the market distortions created by the present system of waste disposal but it does not improve water quality. The author suggests that effluent charges can be used to achieve water quality standards by using the money collected from effluent charges for the construction and operation of sewer treatment facilities. This modified effluent charge proposal combines the state's power to tax with the municipal waste land surcharge to provide an enforcement mechanism for the achievement of water quality standards. WATER FOR CALIFORNIA--OUTLOOK IN 1970.
California State Dept. of Water Resources, Sacramento.

Available from: State of California, Documents Section, PO Box 20191, Sacramento, Calif, 95820, Price $5.00. California Department of Water Resources Bulletin No 160-70, Dec 1970. 179 p, 42 fig, 2 plate, 14 tab.

Descriptors: *Water resources development, *California, *Projects, *Reviews, Planning, Evaluation, Water quality, Urbanization, Land development, Economics, Agriculture, Recreation, Population, Legislation, Wildlife, Electric power demand, Surface waters, Groundwater, Hydrogeology, Watershed management.

Appraisals of water demands for various beneficial purposes throughout the State of California for 1990 and 2020, and the potential sources of water supplies to satisfy those demands are presented. Accomplishments in both planning and water development implementation in the four years since 1966 is discussed. Urban land use is expected to nearly double from 2.3 million acres at present to about 4.5 million acres in 2020 to accommodate the projected population of 45 million. Statewide urban water demands are expected to increase from about 3.7 million acre-feet at present to 6.4 million acre-feet in 1990 and 10.3 million acre-feet in 2020. Overall per capita water demands are expected to increase some 20 percent by 2020. Demands for agricultural water will increase from 24.4 million acre-feet at present to 27.4 million acre-feet in 1990, and 28.7 million acre-feet in 2020. All major urban areas have adequate water supplies from existing projects or facilities authorized or under construction to meet water demands for the next 20 or more years. (Woodard-USGS)

THE LAW PERTAINING TO ESTUARINE LANDS IN SOUTH CAROLINA,
William A. Clineburg, and John E. Krahmer.
South Carolina Law Review, Vol 23, No 1, p 7-24, 1971. 68 ref.

Descriptors: *South Carolina, *Estuaries, *Coastal marshes, *Tidal marshes, Estuarine environment, Estuarine fisheries, Tides, Salt marshes, Marsh management, Land tenure, Legal aspects, Water law, Administration, Administrative agencies, Phosphates, Fishing, State governments.

Evaluated in this article is the law relating to estuarine lands in South Carolina. Estuarine areas are defined as those coastal areas where fresh water from the land meets the salt water of the sea with a daily tidal flow. Estuarine fishing, residential development, and phosphate mining are discussed. The historical development of the law of estuarine ownership during the following periods is examined: (1) under English common law, (2) the colonial period, (3) 1777-1928, (4) 1928-1951, and (5) 1952-1969. In South Carolina estuarine lands are owned by the state, and they are not subject to sale by the Budget and Control Board. They probably are not subject to general sale by the legislature. The legislature can confirm titles to individual pieces of estuarine land and may be able to sell specific tracts by special acts. The problem of managing these lands is complex as there are eight state agencies now administering various aspects of this land. Several agencies of the federal government have duties of control which affect estuarine lands in South Carolina. The author concludes by recommending reorganization of the present administrative structure, perhaps creating a single agency with authority over estuarine lands. (Robinson-Florida)

SUBSIDENCE RESULTING FROM THE REMOVAL OF GROUNDWATERS,
Robert H. Steelhammer, and John G. Garland.
South Texas Law Journal, Vol 12, No 2, p 201-213, 1970. 88 ref.

Descriptors: *Land subsidence, *Percolating water, *Damages, *Water sources, Settlement (Structural), Withdrawal, Subsidence, Percolation, Underground streams, Subsurface waters, Underground, Legal aspects, Water law, Underflow, Groundwater basins, Water rights, Land tenure.

Evaluated in this article are the legal aspects of the problem of subsidence resulting from the removal of underground waters. All underground waters are presumed to be percolating waters in the absence of contrary evidence. There are two conflicting legal doctrines dealing with percolating waters. The English Rule considers percolating water as much a part of the freehold as minerals, and the owner, in the absence of malice, has the absolute right to intercept the water regardless of any effect on his neighbor's land. The American Rule requires that the use of percolating waters must be reasonably necessary for some beneficial purpose. The application of these rules is discussed in light of several cases. Generally each landowner is entitled to lateral support of his neighbor's land irrespective of negligence. The Restatement of Torts has adopted a provision stating that one who is privileged to withdraw underground water is not for that reason privileged to cause a subsidence of the others land. The damages for such a subsidence are the natural, ordinary, or reasonable consequences of the removal of subjacent support. The author concludes that the Restatement position is a valuable step forward. (Robinson-Florida)

ADJUDICATION OF FEDERAL RESERVED WATER RIGHTS,
John C. Guadnola.
University of Colorado Law Review, Vol 42, No 2, p 161-172, 1970. 64 ref.

Descriptors: *Federal-state water rights conflicts, *Reservation doctrine, *Federal jurisdiction, *State jurisdiction, Water rights, Colorado, Legislation, Water supply, Legal aspects, Judicial decisions, Conservation, Appropriation, Appropriation doctrine, Preferences (Water rights), Priorities, Adjudication procedure, Water utilization, Consumptive use, Land.
Identifiers: *McCarran Amendment.

Recently, the Supreme Court of Colorado in United States v. District Court (458 P 2d 760, cert. granted, 38 U.S.L.W. 3379 (U.S. Mar. 30, 1970, No. 1178) asserted jurisdiction to adjudicate federal reserved water rights. This note discusses the Colorado decision, offering support for its holding on the jurisdiction issue and suggesting a way in which any decision on the merits can accommodate the interests of private appropriators and the federal government. The principle obstacle to jurisdiction over federal water rights is sovereign immunity. The only federal legislation waiving such immunity is the McCarran Amendment (43 U.S.C. S 666, 1964), of rights to waters of river systems or other sources, or (2) where the United States owns or is in the process of acquiring water rights by one of several enumerated methods and is a necessary party. The note first considers the Colorado court's reasoning in finding jurisdiction and finds it inadequate. The author then puts forward his own theory, arguing chiefly that since reserved rights are open-ended, private appropriators should have recourse to state adjudication concerning the future availability of water. Nevertheless, state courts must be careful to protect federal interests. The note concludes with a discussion on how this can be accomplished. (Duss-Florida)

PERMITS FOR DISCHARGES OR DEPOSITS INTO NAVIGABLE WATERS.
Corps of Engineers, Washington, D.C.

Federal Register, Vol 36, No 56, Tuesday, March 23, 1971, p 5431-5432.

Descriptors: *Navigable waters, *Permits, *Water pollution, *Regulation, Administration, Federal government, Legislation, Water pollution sources, Water quality, Public health, Water pollution control, Inspection, Environment, Environmental effects, Water Quality Act, Administrative agencies, Water quality control.

In this entry in the Federal Register, the Department of the Army, Corps of Engineers, sets forth proposed regulations for issuance of permits for discharges or deposits into navigable waters. The draft permit first identified the nature of the deposit or discharge approved and any limitations on its character or quality. General conditions governing the permit outline regulations, policies and procedures to be followed by permittees. Penalties that can be invoked upon violation of terms and conditions of permits are listed. Permittees shall comply with applicable state or federal water quality standards. Procedures to be followed when water quality standards become more rigorous are outlined. Permittees shall comply with any regulations or directives issued by the Administrator of the Environmental Protection Agency and with recommendations of any enforcement conference held pursuant to the Federal Water Pollution Control Act. Provisions cover inspection of discharge facilities by the Corps and records to be kept by permittees. The public shall have access to all information concerning specific permits. Other provisions cover: (1) taxation or charges on deposits or discharges; (2) prohibition of construction of facilities on navigable waters; (3) suspension, modification or revocation of permits; and (4) duration of permits. (Duss-Florida)

GRANTS FOR WATER POLLUTION CONTROL.
Environmental Protection Agency, Washington, D.C.

Federal Register, Vol 36, No 59, Friday, Mar 26, 1971, p 5713.

escriptors: *Water pollution control, *Water pollution, *Waste treatment, *Government finance, reatment facilities, Waters pollution treatment, osts, Regulation, Administrative agencies, Administration, Water quality, Environment, Cities, lunicipal wastes, Water pollution sources.
lentifiers: *Environmental Protection Agency.

n this entry in the Federal Register, The Environental Protection Agency (EPA) serves notice iat it proposes to amend its regulations to stablish regulations for the administrator of the PA to reallocate funds appropriated for states for onstruction of waste treatment facilities. The first art of the amendment presents formulas for deterining the amount of the allotment to be given dur- g the fiscal year. The second part of the amendent concerns the reallotment of funds to states here they have not been obligated within the time pecified by law. Procedures which states must folw in order to be entitled to any reallotment are utlined. Prior to making any reallotment, the Adinistrator may determine whether any nobligated funds should be applied to situations of pecial need. In making such a determination the dministrator shall consider the extent: (1) of egradation of water quality, (2) of financial need, 3) of degradation attributable to untreated or inadequately treated waters of municipalities, (4) to hich facilities to be constructed will contribute to ie enhancement of the environment, and (5) ther relevant factors. INANCIAL RESPONSIBILITY FOR OIL POLUTION CLEANUP.
ederal Maritime Commission, Washington, D.C.

ederal Register, Vol 36, No 59, Friday, Mar 26, 971, p 5703-5704.

escriptors: *Administrative agencies, *Administration, *Oil, *Ships, Water pollution sources, Vater pollution, Water pollution control, Legislaon, Federal government, Costs, Regulation.
lentifiers: *Federal Water Pollution Control Act.

Under the Federal Water Pollution Control Act as mended (84 Stat. 97), owners or operators of hips of certain sizes must have evidenced financial esponsibility for potential oil pollution cleanup osts. The Federal Maritime Commission has uthority to promulgate rules and regulations imlementing this requirement and in this entry the Commission sets forth amendments to regulations elating to certification of financial responsibility. The first amendment relaxes the requirement that ertificates be carried on board vessels. The new ule requires that where it is physically impossible o carry the certificate on board the vessel, the certificate number shall be displayed on both bows of the vessel or barge. The second amendment provides for issuance of master certificates to an owner's or operator's entire fleet of vessels. This amendment provides that in lieu of separate certificates persons owning or operating vessels as builders, scrappers, or sellers may apply for a master certificate to cover all vessels up to a specified individual vessel tonnage. Procedures are outlined for complying with this rule. (Duss-Florida)

FINANCIAL RESPONSIBILITY FOR OIL POLLUTION CLEANUP.
Federal Maritime Commission, Washington, D.C.

Federal Register, Vol 35, No 204, Tuesday, Oct 20, 1970, p 16374-16375.

Descriptors: *Oily water, *Pollution abatement, *Water quality control, *Water pollution control, Oil, Oil wastes, Pollutants, Administration, Administrative agencies, Administrative decisions, Regulation, Federal government, Navigable waters, Navigation, Water quality, Water pollution, Legal aspects, Financing.

Pursuant to the Water Quality Improvement Act of 1970, the Secretary of the Federal Maritime Commission proposes this regulation dealing with financial responsibility for oil pollution cleanup. Every application for a Certificate of Financial Responsibility shall be accompanied by an application fee of $100 which is non-refundable. A certification fee is also required for each vessel; this fee shall be either $5.00, $10.00, $15.00, or $20.00 depending on the size of the vessel. Fees are to be made payable in United States dollars and may be paid by check, draft, or postal money order made payable to the Federal Maritime Commission. (Robinson-Florida)
W71-07216

CONTROL OF POLLUTION BY OIL AND HAZARDOUS SUBSTANCES, DISCHARGE REMOVAL.
Federal Register, Vol 35, No 227, Saturday, November 21, 1970, p 17944-17946. 2 tab.

Descriptors: *Oily water, *Pollution abatement, *Water pollution control, *Water quality control, Oil, Oil wastes, Pollutants, Regulation, Administration, Administrative decisions, Administrative agencies, Federal government, Water policy, Water pollution, Water quality, Navigable waters, Navigation, Legal aspects.

Pursuant to the Federal Water Pollution Control Act as amended by the Water Quality Improvement Act of 1970, providing for prevention, cleanup, enforcement, and penalties relating to the discharge of harmful amounts of oil into navigable waters of the United States, the Commandant of the Coast Guard herein promulgates procedures to be followed in the event of such discharges. The Coast Guard has been delegated the authority to assess civil penalties for violation of the statutue or regulations. Any Coast Guard commissioner, warrant, or petty officer is authorized to enforce these regulations. Any person in charge of a vessel or onshore or offshore facility shall notify one of the following officials immediately upon learning of a harmful discharge: (1) the commanding officer of any nearby Coast Guard unit, (2) the commander of the appropriate Coast Guard District, or (3) the federal official designated as the on-scene commander for spill-response purposes. If none of the above can be reached, then either the Commandant of the Coast Guard or the Regional Director of the Federal Water Quality Administration shall be notified. Addresses and phone numbers of certain concerned officials are listed. (Robinson-Florida)
W71-07217

DISCHARGE OF OIL.
Federal Register, Vol 35, No 177, Friday, September 11, 1970, p 14306-14307.

Descriptors: *Oily water, *Pollution abatement, *Water pollution control, *Water quality control, Oil wastes, Oil, Pollutants, Regulation, Administration, Administrative agencies, Administrative decisions, Navigable waters, Water pollution, Water pollution sources, Water quality, Water resources, Legal aspects, Federal government.

Pursuant to section 11 (6) (3) of the Federal Water Pollution Control Act, these regulations pertaining to the discharge of oil are adopted. The regulations apply to the discharge of oil into or upon the navigable waters of the United States or the contiguous zone. Harmful discharges include those which: (1) violate applicable water quality standards, (2) discolor or cause a film or sheen upon the water, or (3) cause a sludge to be deposited beneath the surface of the water. No person shall discharge or cause to be discharged any oil in harmful quantities into the navigable waters of the United States or the contiguous zone. Discharges of oil from a properly functioning vessel engine are not considered harmful, but oil accumulated in the bilges is not exempt. The addition of dispersants or emulsifiers to discharged oil, which would circumvent those regulations, is prohibited. Any person in charge of any vessel or onshore or offshore facility shall notifiy the Coast Guard immediately upon learning of any prohibited discharge. (Robinson-Florida)

ENVIRONMENTAL EDUCATION ACT (NEED FOR EDUCATION CONCERNING ENVIRONMENTAL QUALITY AND ECOLOGICAL BALANCE).
Pub L No 91-516, 84 Stat 1312, 13 US Code Cong and Admin News, p 5353-5357 (1970). 5 p.

Descriptors: *Environment, *Environmental effects, *Education, *Administration, Administrative agencies, Federal government, Legislation, Ecology, Balance of nature, Pollution, Technology, Rural areas, Community development, City planning, Population, Conservation, Resources, Resource development, Government finance, Projects, Public health.

Because of the deterioration in the quality of our environment and its ecological balance, the threat this poses to the public, the poor understanding of the public about environmental issues, and the presently inadequate resources for educating the public about environmental quality, Congress herein enacts the Environmental Education Act. The Act's purpose is to provide broad support for educational programs and projects designed to inform the public about the environment and to enhance environmental quality and maintain the ecological balance. The Act establishes within the Office of Education an office of environmental education to administer the programs authorized by this legislation. Environmental education is defined as the educational process dealing with man's relationship to his natural and manmade surroundings. This includes the relationship between: (1) population, pollution, resource allocation and depletion, conservation, transportation, technology, and urban and rural planning and (2) the total human environment. Provisions authorize the making of grants for education projects and describe activities qualified for funds and criteria for approval of applications for financial assistance. An Advisory Council on Environmental Education is established to assist in the administration of the Act. Other provisions deal with technical assistance by federal agencies, small grants, and authorized appropriations. (Duss-Florida)
W71-07219

LEGISLATION FACILITATING NEGOTIATION OF AN INTERSTATE COMPACT RESPECTING THE HUDSON RIVER.
Pub L 89-605, 80 Stat 847-849 (1966). 3 p.

Descriptors: *Hudson River, *Interstate compacts, *New York, *New Jersey, Vermont, Connecticut, Massachusetts, Rivers, Running waters, Surface waters, Interstate rivers, Legal aspects, Federal government, State governments, Local governments, Water pollution control, Water utilization, Water resources, Water resources development, Legislation.

Under this federal statute the states of New Jersey, Vermont, Massachusetts, and Connecticut may negotiate with each other and the United States for the purpose of establishing a compact dealing with the preservation, restoration, utilization, and development of the natural, scenic, historic, and recreational resources of the Hudson River. The Secretary of the Interior shall represent the United States in such negotiations and report to the President not later than July 1, 1968. In negotiating the compact the following shall be considered: (1) encouragement of all beneficial uses of the lands and waters of the riverway; (2) encouragement of local and state autonomy in planning and action; (3) the need to abate water pollution; (4) the need to preserve, enhance, and rehabilitate the scenic beauty of the riverway; (5) the need to protect fish and wildlife; and (6) the need to preserve and develop archeological and historic sites. All departments, agencies, and instrumentalities of the United States shall consult with the Secretary of the Interior concerning any plans affecting the Hudson River until such time as the states and the United States have had an opportunity to negotiate a compact. (Robinson-Florida)

WATER AND ENVIRONMENTAL QUALITY IMPROVEMENT ACT OF 1970.
H R Rep No 127, 91st Cong, 2d Sess, 4 US Code Cong and Admin News p 809-830 (1970). 22 p.

Descriptors: *Water quality control, *Environment, *Administrative agencies, *Pollution abatement, Pollutants, Oil, Oil industry, Water pollution, Water pollution control, Water pollution sources, Water quality, Administration, Federal government, United States, Ships, Sewage, Sewage disposal, Legislation, Legal aspects, Ecology.
Identifiers: *Water and Environmental Quality Improvement Act of 1970.

The legislative history of the Water and Environmental Quality Improvement Act of 1970 is set forth in this House report. Part I of the report discusses the problems to be corrected by the legislation, while part II delineates the effect of specific sections of the Act. The first topic discussed concerns the control of pollution by oil and other matter, noting the Torrey Canyon disaster and the Santa Barbara Channel oil spills and determining that present legislation is inadequate to deal with such situations. A discussion of oil pollution considers the effect of the Act upon financial responsibility and liability for oil spills. The topic dealing with control of sewage from vessels shows committee awareness of the antiquity of vessels in the United States merchant fleet and allows a reasonable margin for such vessels to continue operation under the new standards. The remaining topics are concerned with area acid and other mine water control demonstrations and cooperation by federal agencies pollution control, including appropriations for the new program. Part II provides a section-by-section explanation of the bill as it pertains to each of the foregoing problem areas, and contains a section on training personnel in water quality control. (Hart-Florida)
W71-07221

ENVIRONMENTAL FINANCING ACT OF 1971 (A BILL TO ESTABLISH AN ENVIRONMENTAL FINANCING AUTHORITY TO ASSIST IN THE FINANCING OF WASTE TREATMENT FACILITIES).

Senate Bill 1015, 92d Cong., 1st Sess (1971). 11 p.

Descriptors: *Construction costs, *Waste treatment, *Treatment facilities, *Government finance, Water pollution control, Pollution abatement, Legislation, Federal government, State governments, Local governments, Cities, Administration, Cost sharing, Cost repayment, Capital costs, Financing, Interest, Debt, Loans, Repayment contracts, Government supports, Grants, Administrative agencies, Legal aspects.
Identifiers: *Water Pollution Control Act, *Environmental Financing Act.

The Environmental Financing Act of 1971 would assure that the inability to borrow necessary funds on reasonable terms does not prevent any state or local public body from carrying out projects for construction of waste treatment works. An Environmental Financing Authority would be established and authorized to purchase, on terms and conditions determined by the Authority, any obligation which is issued by a state or local public body to finance the non-federal share of the cost of any project for the construction of waste treatment works which have been determined to be eligible for federal financial assistance under the Federal Water Pollution Control Act. To obtain assistance, a public body must be unable to obtain on reasonable terms sufficient credit to finance its actual needs. Initial capital for the Authority is provided, along with capacity to issue obligations, general powers, tax exemption, and administrative regulations. Pursuant to this Act other federal acts would be amended as necessary. (Smiljanich-Florida)
W71-07222

DETERGENT POLLUTION CONTROL ACT OF 1971 (A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT TO ESTABLISH STANDARDS AND PROGRAMS TO ABATE AND CONTROL WATER POLLUTION BY SYNTHETIC DETERGENTS).

Senate Bill 75, 92d Cong, 1st Sess (1971). 14 p.

Descriptors: *Detergents, *Pollution abatement, *Phosphates, *Water quality control, Chemical wastes, Domestic wastes, Industrial Wastes, Water pollution sources, Water pollution effects, Federal government, Adoption of Practices, Legislation, Alkylbenzene sulfonates, Eutrophication, Biodegradation, Toxicity, Public health, Sewage treatment, Standards, Regulations, Adjudication procedure, Administrative agencies, Interstate, Industrial production, Legal aspects.

The Detergent Pollution Control Act of 1971 would establish standards and programs to abate and control water pollution by synthetic detergents. Recent studies demonstrate the extent to which polyphosphates in detergents contribute to water pollution due to eutrophication and toxicity caused by their nondegradability. This Act would require the use of non-polluting, safe substitutes for detergent polyphosphates in order to protect lakes and rivers from further pollution from this source. The Administrator of the Environmental Protection Agency would be authorized to establish standards of water eutrophication ability, biodegradability, toxicity, and of effects on the public health and welfare which must be met by all synthetic detergents, according to the procedures prescribed herein. Any detergent which after a future date does not conform with the standards would be prohibited from introduction or delivery into interstate commerce. Criminal penalties are provided, along with procedures for the enforcement of the standards. Appropriations would be made for research and development of pollution-free detergents. (Smiljanich-Florida)
W71-07223

A BILL TO ASSIST THE STATES IN ESTABLISHING COASTAL ZONE MANAGEMENT PLANS AND PROGRAMS.
Senate Bill 638, 92d Cong, 1st Sess (1971). 19 p.

Descriptors: *Coasts, *Water resources development, *Water quality control, *Cost sharing, Federal government, State governments, Legislation, Oceans, Continental Shelf, Estuaries, Estuarine environment, Aquatic environment, Pollution abatement, Water management (Applied), Administration, Planning, Project purposes, Administrative agencies, State jurisdiction, Federal project policy, Financing, Industrial production, Inter-agency cooperation, Geographical regions, Legal aspects.

The coastal states need encouragement and assistance in exercising effectively their responsibilities over the coastal zone through the preparation and implementation of management plans and programs to achieve wise use of the coastal zone through a balance between development and protection of marine resources. To assist the states in establishing coastal zone management plans and programs, this amendment to a prior Act (16 USC 1121 et seq) would authorize grants for a portion of the cost. The Secretary of Commerce would be authorized to make annual grants to any coastal state for the purpose of assisting in the development and administering of such programs. The grants would not exceed one half of the cost to any state. The Secretary would examine the plans prior to granting approval, and would promulgate rules and regulations necessary for the provisions of the Act. A coastal zone management advisory committee would advise the Secretary on matters of policy concerning the coastal zones. Provisions are included for inter-agency cooperation, annual reports, and appropriations. (Smiljanich-Florida)

FUNCTIONS OF CORPS OF ENGINEERS IN ISSUING PERMITS FOR WORK IN NAVIGABLE WATERS.
33 Code of Federal Regulations, Sec 209.120 (1970). 8 p.

Descriptors: *Administrative agencies, *Administration, *Navigable waters, *Construction, Permits, Regulation, Navigation, Fish, Wildlife, Conservation, Water pollution, Ecology, Federal government, Navigable rivers, Harbors, Piers, Dams, Dikes, State governments, Flood control, Prospects, Recreation, Water policy, Legal aspects, Channels.

Outlining the administrative procedure under which the Corps of Engineers operates, this federal regulation describes the Corps' functions, jurisdiction, and policies in granting permits for work in navigable waters. The Corps supervises river, harbor, and flood control improvements authorized by law and administers certain laws for the protection and preservation of navigation and navigable waters in the United States. The regulation lists the principal laws concerning navigation and navigable waters over which the Corps has jurisdiction. Most of these laws relate to various types of construction on waterways and improvements in navigable rivers. The Chief of Engineers of the Corps has been authorized to delegate authority to district engineers to issue permits for work done in or over navigable waters. Procedures for obtaining permits are outlined. The general policy for issuing permits rests on an evaluation of all relevant factors, including the effect of the proposed work on navigation, fish and wildlife, conservation, pollution, aesthetics, ecology, and the general public interest. Other provisions describe the relation between the Corps and other authorities in issuing permits and issuance of permits where proposed improvements may effect flood control projects, coastal waters, the flow of water, water quality, or other aspects of navigation. ERS, DREDGING, ETC, IN WATERWAYS.
Code of Federal Regulations, Sec 209.130 970) 11 p.

escriptors: *Dredging, *Piers, *Administrative cisions, *Permits, Channel improvement, En- neering structures, Docks, Abutments, Federal vernment, Administration, Legal aspects, Ad- inistrative agencies, Regulation, Water resources, ater policy, Engineering, Navigation, Navigable aters

pplication for a permit to construct piers or edge in waterways consists of a letter requesting e permit accompanied by maps and plans of the oposed work. This letter is submitted to the Dis- ct Engineer in charge of the concerned locality. hile there is no prescribed form, the letter must ntain the following: (1) address of applicant, (2) te, (3) name of the waterway, (4) location of ork, (5) description of work, and (6) a statement to whether the work is within the corporate nits of a municipality. Responsibilities of the Dis- ct Engineer are specified in this regulation. The eparation of maps and plans is also explained. he contents of permits are discussed, pointing out e responsibilities of the parties. Specification for ectrical transmission lines are detailed. Generally pplicants have three years to complete work, but tensions may be granted. If future operations by e United States require an alteration in the posi- on of the structures or work or if, in the opinion of e Secretary of the Army, it would cause un- asonable obstructions to navigation, the owner ll be required to remove the obstruction without pense to the United States. entifiers: *Public Land Law Review Commission.

he Natural Resources Council of America has un- rtaken to review and analyze the work of the blic Land Law Review Commission. The Com- ission was directed to determine the best uses of me 700 million acres of public lands and to make commendations concerning the laws governing ese public lands. The review is conducted in ree parts. Part one, entitled 'Reviews of One- hird of the Nation's Land', includes: (1) a review the commission's final report; (2) environment d water resources; (3) fish and wildlife relations;) the Outer Continental Shelf; (5) administrative d legislative jurisdiction; and (6) disposal and re- ntion of public lands. Part two, entitled 'Indepen- nt Reviews of Reports' includes: (1) regional and cal land use planning; (2) public land timber pol- y; (3) water resources; (4) fish and wildlife sources; (5) outdoor recreation uses; and (6) venue sharing in lieu of taxes. Part three includes ports on the eleven meetings held by the Com- ission, the Advisory Council, and Governors' presentatives. The reports are not verbatim, but e accounts attempting to capture the sense of scussion and provide a useful background for un- rstanding consideration of problems and recom- ended solutions. OMMENTS ON THE MAKEUP AND IRECTION OF THE PUBLIC LAND LAW REVIEW COMMISSION'S FINAL REPORT AND RECOMMENDATIONS,
Hamilton K. Pyles.
In: What's Ahead For Our Public Lands, Natural Resources Council of America, p 4-12 1970. 37 ref.

Descriptors: *Public lands, *Federal reservations, *Administrative agencies, *Resource development, Conservation, Land use, Land development, Land resources, Non-structural alternatives, Economics, Land management, Land, Federal government, State governments, Local governments, Planning, Future planning (Projected), Project planning, Legislation.

The Public Land Law Review Commission's report is organized to accommodate the finding of the study program; accordingly, in the author's opinion it is rather disjointed. Chapters One and Two describe 'where and what are public lands' and to whom they are important. Plenary recommendations on coordinating public land use with environmental problems are covered in Chapters Three and Four. Major individual commodities and services in the use of public lands are contained in Chapters 5-13. Chapters 14-19 deal with such special problems as 'land grants to the states' and 'federal legislative jurisdiction'. Recommendations on organization, administration, and budgeting are in Chapter 20. Despite disavowals, economic considerations appear to dominate the rationale for many recommendations. It is suggested that Congress should become more involved in establishing guidelines for land use and disposal. Also, the report urges state and local governments to become more involved with disposition of public lands within their borders. Additionally, the report advocates greater public participation in public land-use planning and in developing an understanding of the nature and extent of permitted uses. THE ENVIRONMENT AND WATER RESOURCES,
Harold G. Wilm.
In: What's Ahead For Our Public Lands, Natural Resources Council of America, p 47-57, 1970.

Descriptors: *Water resources, *Land resources, *Environment, *Federal reservations, Area redevelopment, Water resources development, Public lands, Administrative agencies, Non-structural alternatives, Land management, Federal government, State governments, Planning, Future planning (Projected), Project planning, Legislation, Lumber, Forests, Land development.

Under the dominant land use concept, if a tract of public land is classified for timber production, the land manager may be tempted to manage entirely for wood production. However, the dominant use concept should be broadened to include the greatest net public benefit theory, maximizing all resource values. Comprehensive land-use planning should be effected, focusing on administrative policies and intergovernmental procedures to include cost-sharing guidelines and proposing alternative actions for contingencies. However, financial assistance furnished the states is inadequate to enable them to exert full responsibility for water and land resource planning. Also, although the statutory goals are laudatory, they are too general for use by land managers; the goals must be much more explicit and descriptive. It is suggested that government should sell water arising from and leaving public lands at prices equal to the net cost of watershed and forest management prices. Although the Public Land Law Review Commission recommended merger of the Forest Service and the Department of the Interior into a new Department of Natural Resources, the recommendation was opposed because of administrative complications. W71-07229

FISH AND WILDLIFE AS RELATED TO OTHER RESOURCES AND VALUES,
Phillip W. Schneider.
In: What's Ahead for Public Lands, Natural Resources Council of America, p 58-74, 1970.

Descriptors: *Fish, *Wildlife, *Water resources, *Land resources, Lumber, Lumbering, Environment, Federal Reservations, Area redevelopment, Water resources development, Public lands, Administrative agencies, Non-structural alternatives, Land management, Federal government, State governments, Planning, Future planning (Projected), Project planning, Legislation, Forests, Land development.

The author of this article finds two recommendations of the Public Land Law Review Commission to be highly objectionable: (1) replacement of the multiple-use doctrine with a dominant use concept; and (2) a strong emphasis on statutory direction of non-commodity values and their management. The primary objective of the public land custodian should be to manage federal public lands to prevent damaged environmental quality and enhance the quality of the environment where feasible. Domestic livestock grazing is the largest past and present use; timber production on federal land represents one-third of the nation's output; there are 8245 producing mineral leases on federal lands; and commercial and recreational occupancy are important uses. Public land policy, while assuring environmental quality, must also encourage economic growth. Furthermore, clear statutory authority should be given to federal officials for final land use decisions that affect fish and wildlife habitats or populations on public lands. A federal-state fish and resident wildlife coordinating committee should be established in each state. Upon disposal of federal public lands, rights should be retained to protect fish and wildlife. THE OUTER CONTINENTAL SHELF,
Frank J. Barry.
In: What's Ahead For Our Public Lands, Natural Resources Council of America, p 75-84, 1970. 10 p, 19 ref.

Descriptors: *Administrative agencies, *Submerged Lands Act, *Oil, *Regulation, Administrative agencies, Leases, Exploitation, Federal jurisdiction, Federal government, State jurisdiction, Oil fields, Legislation, Oil industry, Beds, Beds under water, Continental Shelf.
Identifiers: *Outer Continental Shelf Lands Act.

The resources, Legislation, Regulations, and Commission's recommendations concerning the Outer Continental Shelf are considered in this article. The Continental Shelf is defined, and exploitation of mineral resources, both present and future, discussed. Two acts, the Submerged Lands Act and the Outer Continental Shelf Lands Act, directly affect exploitation of the shelf, and they are briefly considered. Regulations promulgated by the Secretary of the Interior under the Acts are commented upon. Although the federal legislation was intended to pre-empt state intervention in the Outer Continental Shelf, several states attempt to regulate oil production. Deficiencies listed in administration of the Outer Continental Shelf are: (1) failure of federal authorities to exercise exclusive jurisdiction and to permit production at the maximum efficient rate; (2) failure to prescribe and enforce strict regulations for environmental protection; (3) failure to conduct pre-leasing investigations to obtain maximum remuneration; and (4) failure to permit leasing by small independent operators. Also, the many recommendations of the Public Land Law Review Commission are discussed and criticized in detail. (See also W71-07227) (Hart-Florida)

POLICY, PLANNING, AND ADMINISTRATION,
Lynton K. Caldwell.

In: What's Ahead For Our Public Lands, Natural Resources Council of America, p 116-1281970. 13 p, 4 ref.

Descriptors: *Planning, *Administration, *Administrative agencies, *Federal project policy, Projects, Project planning, Project purposes, Future planning (Projected), Decision making, Programs, Non-structural alternatives, Adoption of practices, Coordination.

Those portions of the report of the Public Land Law Review Commission concerned with overall policy, planning, and administration are examined in this review. It is not concerned with specific resource use nor with primarily technical aspects of law or fiscal policy. The author first examines the context of the report and its general character and orientation, then considers three groups of recommendations pertaining to policy, planning, and administration, and concludes with observations on how the commission's report may best be used. Major topics are entitled: (1) characterizing the report; (12) underlying premises and assumptions; (3) some specific recommendations, which include land use planning, land policy and the environment, and administrative organization; and (4) implementing the recommendations. W71-07232

THE DEVELOPMENT, MANAGEMENT, AND USE OF WATER RESOURCES ON THE PUBLIC LANDS,
Edward Weinberg.
In: What's Ahead For Our Public Lands, Natural Resources Council of America, p 181-189, 1970.

Descriptors: *Water resources development, *Water management (Applied), *Public land, *Water utilization, Reservation doctrine, Administrative agencies, Legal aspects, Judicial decisions, Water allocation (Policy), Eminent domain, Condemnation, Preferences (Water rights), Federal government, Non-structural alternatives, Water policy, Water requirements, State governments.

In this review of the Public Land Law Review Commission's 'Study of the Development, Management, and Use of Water Resources on the Public Lands' two legal issues are considered: (1) does the present legal system provide for federal rights adequate for present and future uses on the public lands; and (2) do federal water rights under the present legal system interfere with or obstruct beneficial use of available water for beneficial non-federal public and private purposes. The author believes the study unduly magnifies uncertainties posed by the reservation doctrine and its potential for obstructing beneficial use, citing three reasons for his view: (1) the quantity of water required by federal agencies is negligible in comparison with the total western state requirements; (2) only one instance is shown where the reservation doctrine permitted taking a water right vested under state law without compensation; and (3) conclusions are based upon inferences rather than judicial decisions. Implications of the reservation doctrine upon conservation interests are also considered. The author believes that the fundamental question presented is whether the reservation doctrine is meritorious and serves a useful purpose. (See also W71-07227) (Hart-Florida)

REVIEW OF THE REPORT ON FISH AND WILDLIFE RESOURCES ON PUBLIC LANDS,
Lloyd W. Swift.
In: What's Ahead For Our Public Lands, Natural Resources Council of America, p 190-201, 1970.

Descriptors: *Administrative agencies, *Public lands, *Fish, *Wildlife, Permits, Federal government, State governments, Federal reservations, National parks, Recreation, Fish management, Fish conservation, Wildlife conservation, Highway effects, Hunting, Wildlife management, Animal control, Balance of nature, Wildlife habitats, Habitat improvement, Legislation, Financing, Government finance.

In reviewing the report by the Public Land Law Review Commission on fish and wildlife resources on public lands, this article considers: (1) objectives of the study; (2) methods used; (3) accuracy; (4) inclusiveness; (5) accuracy of analysis; (6) problem and policy issue identification; and (7) alternatives. Some propositions discussed in the section dealing with alternatives are: (1) harvest fish and game on federal lands; (2) federal-state cooperation in fish and wildlife management; (3) responsibility for habitat management on federal lands; (4) return of ceded fish and wildlife jurisdiction to the states; (5) use of water for fish and wildlife management on federal lands; (6) highway planning in relation to fish and wildlife management; (7) recreational use of wildlife refuges; (8) public hunting to control game animals in national parks; (9) simplifying statutes pertaining to fish hatcheries and wildlife refuges; (10) single jurisdiction over federal land areas; (11) retention of important fish and wildlife values in disposal of public lands; (12) increasing the disposals of land for fish and wildlife management through the Recreation and Public Purposes Act; (13) increasing federal funds for fish and wildlife programs on federal lands; and (14) requirements for state hunting and fishing licenses on federal lands. A REPORT ON THE PUBLIC LAND LAW REVIEW COMMISSION MEETING, FEBRUARY 21, 1969, WASHINGTON, DC,
Hamilton K. Pyles.
In: What's Ahead For Our Public Lands, Natural Resources Council of America, p 244-251, 1970.

Descriptors: *Continental shelf, *Administrative agencies, *Beds under water, *Public lands, Judicial decisions, Legal aspects, Administration, Administrative decisions, Beds, Oil, Oil industry, Oil fields, Regulations, Federal project policy, State governments, Federal jurisdiction, Leases, Boundary disputes, Environment, Conservation, Natural resources, Legislation, Project planning, Water policy.

The topics discussed at this meeting of the Public Land Law Review Commission were Outer Continental Shelf lands and administrative procedures on public lands. The report on the Outer Continental Shelf attempts to capture the sense of the various viewpoints regarding major policy issues or possible alternatives to the existing systems of law, regulation, and policies. Six questions were considered at the meeting on the Continental Shelf; the positions represented on the questions were: (1) oil, gas, and mining interests wished to continue the present regulation system of exploitation, with no requirement to divulge 'trade secrets' and without leasing of hard minerals; (2) states adjacent to the Shelf desired a firm boundary and larger role in development of policy, regulations, and practices, and a share of revenues; and (3) more general interests desired increased emphasis upon the Shelf's environment and coordinated resource management. The section on administrative procedures was primarily concerned with administrative law relating to public lands. (See also W71-07227) (Hart-Florida)
W71-07235

A REPORT ON THE PUBLIC LAND LAW REVIEW COMMISSION MEETING, APRIL 17-18, 1969, WASHINGTON, DC,
Hamilton K. Pyles.
In: What's Ahead For Our Public Lands, Natural Resources Council of America, p 252-259, 1970.

Descriptors: *Public lands, *Fish, *Wildlife, *Water resources, Administrative agencies, Administrative decisions, Administration, Reservation doctrine, Conservation, Fish conservation, Federal reservations, Land tenure, Fish management, Wildlife conservation, Wildlife habitats, Wildlife management, Recreation, Hunting, Fishing, Natural resources, Legal aspects.

This article reviews the Public Land Law Review Commission meeting considering: (1) fish and wildlife resources on the public lands and (2) the development, management, and use of water resources on the public lands. Five questions concerning each of these two topics were discussed at the meeting. For example, two questions on fish and wildlife resources were: (1) should the fact that public lands are valuable for fish and wildlife support and use constitute the determinant, standing alone, as to whether such public lands should be disposed of or retained in federal ownership; and (2) what should be the role of federal lands and resources in supporting, protecting, and enhancing various fish and resident species, and in providing for their use and enjoyment by individuals. The responses given to the questions are analyzed and commented upon. The questions presented in the water resources section are similarly considered and discussed. An example of the water resource questions is: does the present legal system provide for federal water rights adequate for present and future uses on the public lands. WATERS V PUTNAM (REVIEW OF ADMINISTRATIVE DECISION AS TO REPRESENTATION ON WATERSHED DISTRICT BOARD).
183 NW 2d 545-551 (Minn 1971).

Descriptors: *Minnesota, *Watershed management, *Water districts, *Administrative decision, Administrative agencies, Adjudication procedure, Water allocation (Policy), Decision making, Legislation, Flood control, Surface runoff, Water zoning, Water resources development, Local governments, State governments, Cities, Surface waters, Water conservation, Water management (Applied), Judicial decisions, Legal aspects.

Plaintiff landowners sought writs of certiorari and mandamus in obtaining review of defendant Water Resources Board's refusal to reopen proceedings establishing a watershed district. Plaintiff contended that appeal by certiorari was necessary, as there was no regular appeal procedure from the Water Resources Board's decision, and that the Board should be forced to reapportion the board of managers of a multi-county watershed district according to the water conservation needs of the area. Defendant contended that plaintiffs had normal appellate procedures open to them and that the Water Resources Board, in exercising its discretion, had no obligation to insure equal representation on the board of managers. In affirming the quashing of the writs by the lower court, the Supreme Court of Minnesota noted that plaintiffs had normal appellate procedures for judicial review which it failed to utilize in timely fashion. In exercising its discretion, the Water Resources Board had no constitutional obligation to insure equal county representation on the board. (Sedlacek-Florida)

BROOKS V VOLPE (CONSTRUCTION OF HIGHWAY NEAR RECREATION AREA).
319 F Supp 90-92 (WD Wash 1970).

Descriptors: *Highways, *Highway effects, *Recreation facilities, *Camp sites, Federal government, Environmental effects, Parks, Recreation, Wildlife, Wildlife conservation, Waterfowl, Legislation, Streams, Ecology, Environment, Legal aspects, Judicial decisions.
Identifiers: *National Environmental Policy Act, *Federal-Aid Highway Act.

Plaintiffs sought a preliminary injunction to enjoin defendants, representing the Department of Transportation, from constructing part of an interstate highway on the northern border of a campgro

l recreational area. Plaintiffs alleged non-com-
ance with portions of the Federal-Aid Highway
t of 1968 and the National Environmental Policy
t of 1969. Plaintiffs contended that the former
restricted and conditioned the use of public
rks, recreational areas and wildlife-waterfowl
uges and that the latter act required a detailed
ject statement by the defendants, which they
l failed to prepare. The federal district court de-
d the injunction. The proposed highway north of
campground areas was not a use contemplated
the Federal-Aid Highway Act. The National En-
onmental Policy Act was prospective and not
rospective legislation, and the administrative
ision concerning location of the highway was
de prior to passage of the act. Therefore a
ailed statement was not required. (Duss-
rida)

PROVIDING ENVIRONMENTAL SCIENCE SERVICES,
Department of Commerce, Washington, D.C.
Walter A. Hahn.
Public Administration Review, Vol 28, No 4, p 326-341, July-Aug 1968.

Descriptors: *Environment, Federal government, Management, Planning, Coordination.
Identifiers: *Environmental Science Services Administration, Department of Commerce, Environmental policy analysis.

It is the purpose of this article to describe the origins and subsequent developments of the Environmental Science Services Administration (ESSA) as an experiment in public administration. It briefly traces what has come of the 'ESSA idea' from its conceptual origins to its current manifestation. Some of the services performed by ESSA are: Hazard warning, aid to business and government, consumer benefits, aid to other federal agencies, and assistance in maintaining environmental quality. The ESSA, formed in 1965, combines the environmental science and service capabilities and activities of the Weather Bureau, the Coast and Geodetic Survey, and the Central Radio Propagation Laboratory. Today there exists under one organizational roof the Department of Commerce's activities in seismology, oceanography, hydrology, meteorology, geophysics, hydrography, aeronomy, geodesy, geomagnetism and telecommunications. The ESSA idea also encompasses a concept labelled 'the multiple use of technology'--using modern technology to solve environmental problems. Another concept of equal importance is a broad program of both long-range, mission-oriented research and development. The essence of ESSA's entire output is information: Warnings, forecasts, charts and reports, consulting and research, science and technology. ESSA has provided leadership in a number of international environmental activities. In order to work effectively in the future, environmental policy analysis is urgently needed. (Wray-Chicago)

THE SAN FRANCISCO BAY PLAN: COMBINING POLICY WITH POLICE POWER,
E. Jack Schoop, and John E. Hirten.
Journal of the American Institute of Planners, p 2-10, Jan 1971.

Descriptors: *Water policy, Decision making, Management, Methodology, Dredging.
Identifiers: *San Francisco Bay Plan, *San Francisco Planning and Urban Renewal Association, *Police power, Fill control power, Comprehensive plan.

In 1969, the San Francisco Bay plan received an AIP Award of Merit in recognition of its methodology and relevancy. It also won sufficient political support to secure the establishment of a permanent commission to carry out the plan. Extensive participation of the public and decision makers was employed to develop needed support. Capitalizing on its interim power to control filling and dredging while the plan was being prepared, the San Francisco Bay Conservation and Development Commission openly developed its plan as a series of policy decisions establishing a legal and technical frame of reference for use of the fill control power. Policy issues in the plan are clear-cut and relevant, and a tight management system was used to orchestrate the participation of many consultants and a large number of decision makers and interest groups. The process is being continued in modified form as the commission begins implementation of the plan. (Wray-Chicago)

A NEW KIND OF INSTITUTION,
New England River Basins Commission, Boston, Mass.
Frank Gregg.
Water Spectrum, Army Corps of Engineers, Spring 1971, p 26-32.

Descriptors: *Water Resources Planning Act, Coordination, Management, *Regional analysis.
Identifiers: *New England River Basin, Southeastern New England, State focus, Federal-State cooperation, Joint planning.

The New England River Basins Commission has considered since its founding in 1967 how it can best contribute to sound management of the region's water and related land resources. A major output of the commission is expected to be reports which recommend Federal, State, local and private actions to meet public needs for conservation and use of waters and related lands. The Commission's strategy for completing the comprehensive joint plan includes: (a) a New England Framework to provide information, (b) water and land management plans for each state, (c) water and land management plans for selected sub-regions. A principle weakness of coordinated planning to date is that the planning process is not seen by all participants (Federal and State) as a vehicle that each can use for planning its own action programs. The Commission aims to develop a planning approach by which Federal and State agencies develop positive plans for major uses--from preservation of ecological systems to intensive development projects. To achieve joint planning, the Commission will assemble a professional staff team for each formally organized study. They will formulate broad policy guidelines. Federal agencies, working with their State counterparts, will be responsible for planning for specific uses and functions: flood control, water supply and quality control, outdoor

recreation, fish and wildlife, etc. Appropriations for participation by Federal agencies and Commission staff in joint studies will be requested through coordinated budgets submitted to the Water Resources Council. Cost of organized State participation in joint plans will be born primarily by the States, assisted by Federal planning grants. (Wray-Chicago)

MALTA CONFERENCE - PACEM IN MARIBUS.

Lawyer of the Americas, Vol 2, No 3, p 481-497, Oct 1970.

Descriptors: *Conferences, *Oceans, *Resources, *Ecology, *Water pollution, *Legal aspects, Oil wastes, Exploration, Fisheries, Law of the Sea.
Identifiers: *Malta Conference 1970, Atlantic - Pacific Canal.

Some sixty countries participated in the 1970 Malta Conference which was sponsored by the Center for the study of Democratic Institutions in Santa Barbara, California. Their intent was to generate support for the establishment of a continuing body in Malta to guide the United Nations and others regarding decisions about the ocean. Political and legal problems, the extraction of living and non-living resources, and science policy and ecology were discussed. Fisheries problems, non-living resource exploitation policy and jurisdiction, U.S. - U.S.S.R. Draft Treaty on Prohibiting the Emplacement of Nuclear Weapons on the Seabed and Ocean Floor, limits of National Jurisdiction, and President Nixon's proposal for a seabed regime were included. The need for conservation, rational use of ocean resources and pollution were considered in conjunction with the above subjects. (Ensign-PAI)

CALIFORNIA ENVIRONMENTAL LAW - A GUIDE.
Center for California Public Affairs, Claremont.

Center for California Public Affairs, Claremont, Cal, 1971. 171 p, 79 ref.

Descriptors: *California, *Legislation, *Environment, *Air pollution, *Water quality, *Land use, *Solid wastes, *Pesticides, *Radiation, Laws, Statutes.

The major state laws regulating environmental quality in California including amendments and new laws enacted by the 1970 legislature are summarized. The scope, major provisions and arrangement of selected statutes are outlined. The core of California law concerning air quality, land use, solid waste management, noise control, pesticides and radiation are described. Selected bills which were not passed are summarized as there is a good possibility that they will be re-introduced in the 1971 legislature. (Ensign-PAI)

STANDARDS-SETTING CONFERENCES, HEARINGS, AND NOTIFICATION OF ALLEGED VIOLATORS OF WATER QUALITY STANDARDS.
18 Code of Federal Regulations, part 604 (1970). 5 p.

Descriptors: *Administrative agencies, *Adjudication procedure, *Water quality, *Regulation, Water quality control, Water pollution, Water pollution sources, Water pollution control, Pollution abatement, Administration, Legislation, Federal government.

Procedures for revision of water quality standards and for public hearings on water quality are established in this regulation. Definitions of various terms, such as 'Act', 'commissioner', and 'water quality standards', are first provided. Then, provisions are set forth for: (1) INITIATION OF WATER CONFERENCES, (2) organization and general procedures of conferences, (3) notice of conferences, (3) notice of conferences, (4) service of notice, (5) publication of notice, (6) parties, (7) presentation of material by the Federal Water Pollution Control Administration, (8) conference procedure, (9) record of proceedings, and (10) promulgation of water quality standards. Provisions concerning water quality public hearings relate to: (1) initiation of proceedings and appointment of the hearing board, (2) organization and general provisions of the hearing board, (3) notice of hearing, (4) service of notice, (5) publication of notice, (6) parties, (7) presentation of material by the commissioner, (8) records of procedure, (9) oral arguments, and (10) final findings and recommendations. In addition, provisions are promulgated for notification of alleged violators of water quality standards by the Secretary. (Hart-Florida)

FILING OF REPORTS WITH SECRETARY OF THE INTERIOR BY PERSONS WHOSE ALLEGED ACTIVITIES RESULT IN DISCHARGES CAUSING OR CONTRIBUTING TO WATER POLLUTION,

18 Code of Federal Regulations, part 607 (1970). 3 p.

Descriptors: *Administrative agencies, *Water pollution control, *Regulation, *Water pollution sources, Water pollution, Legislation, Federal government, Water quality, Water quality control, Pollution abatement, Pollutants, Thermal pollution, Pollutant identification, Water pollution treatment, Administration.

At the request of a majority of conferees at any conference, or in connection with a hearing under the Federal Water Pollution Control Act, the Secretary of the Interior may require any person whose alleged activities result in discharges causing or contributing to water pollution of waters which are the subject of the conference or hearing to report the character, kind, and quantity of discharges, and methods used to prevent pollution. The request for the written report may be served by mailing. No particular form for the report is required unless specified by the Secretary. The report, based on existing data, must identify the causes, sources, and physical, chemical, and biological properties of the pollutional discharge. Also, the thermal characteristics and the 24 hour daily quantity of the discharge must be reported. Facilities used to prevent or reduce the discharges are to be described. The report shall be filed in five copies within the time specified by the Secretary. Trade secrets are not required to be disclosed, and all data shall be considered confidential. The penalty for failure to comply is forfeiture of $100 for each day of default. (Hart-Florida)

HALLS LEVEE DISTRICT V HAUBER (ILLEGAL CONSTRUCTION OF DAM ACROSS LEVEE DISTRICT'S DITCH).
461 SW2d 16-24 (Ct App Mo 1970).

Descriptors: *Missouri, *Drainage districts, *Dams, *Ditches, Flood control, Easements, Right-of-way, Drainage, Levees, Lakes, Remedies, Land reclamation, Public rights, Relative rights, Water levels, Benefits, Outlets, Judicial decisions, Legal aspects, Missouri River.

Defendants appealed from a judgment granting plaintiff, a county levee district, a mandatory injunction requiring defendants to remove a rock dam. Defendants had erected the dam across a drainage ditch maintained by the plaintiff. Defendants had originally removed a dam built by the district and subsequently sought permission from it to rebuild the dam. Permission was denied, but defendants nevertheless built the dam. Defendants contended the trial court erred because: (1) plaintiff had an adequate remedy at law by filing another reclamation plan, (2) removal of the dam would be contrary to plaintiff's present reclamation plan, (3) plaintiff had no drainage rights over defendants' land, and (4) plaintiff's suit enforced private rights and not district rights. The Kansas City Court of Appeals both affirmed and amended the lower court decision for plaintiff. Plaintiff's equity action was proper as its legal remedy would have constituted an unnecessary delay in securing relief. Moreover, removal of the illegal dam would not be contrary to the district's reclamation plan, and the question of the plaintiff's rights of drainage across defendants' land was irrelevant to the case. Finally, plaintiff was legally entitled to maintain the suit notwithstanding the fact that success might result in benefits to the private rights of resident landowners. (Duss-Florida)

DRINKWINE V STATE (REASONABLE USE DOCTRINE AS APPLIED TO PERCOLATING WATERS).
274 A2d 485-487 (Vt 1970). 3 p.

Descriptors: *Vermont, *Percolating water, *Reasonable use, *Relative rights, Competing uses, Water supply, Water shortage, Groundwater, Water conservation, Groundwater mining, Water demand, Water requirements, Land tenure, Water rights, Springs, Subsurface waters, Water wells, Pumps, Withdrawal, Water table, Water rights, Administrative agencies, Judicial decisions, Legal aspects.

Plaintiff landowners sought to enjoin defendant State Fish and Game Department from continuing to operate certain pumps and wells which allegedly pumped unreasonable amounts of water to the detriment of plaintiff's springs. Plaintiff contended that the doctrine of reasonable use should apply to percolating waters due to the present increased scarcity and value of water as a commodity. Defendant contended that the doctrine of reasonable use did not apply to percolating waters and that plaintiff had failed to adequately allege the scarcity of water and the causal connection between defendant's pumping and the depletion of plaintiff's springs. In affirming a lower court order dismissing plaintiff's complaint, the Supreme Court of Vermont noted that the doctrine of reasonable use has no application to the case. Percolating waters are regarded as a part of the land and, as such, no correlative rights in the waters exist between adjacent landowners. The allegations of fact were insufficient to show a scarcity of waters in Vermont or a causal connection between defendant's actions and plaintiff's injury. (Smiljanich-Florida)

GRANT V KATSON (INJUNCTION TO PREVENT UPHILL LANDOWNER FROM FURTHER DIVERSION AND INCREASE IN SURFACE WATER RUNOFF).
274 A2d 88-90 (Md App 1971). 3 p.

Descriptors: *Maryland, *Surface runoff, *Diversion, *Remedies, Drainage effects, Alteration of flow, Land tenure, Competing uses, Damages, Erosion, Baffles, Concrete structures, Diffusion, Runoff, Repulsion (Legal aspects), Riddance (Legal aspects), Artificial use, Judicial decisions, Legal aspects.

Plaintiff landowner brought action for continuing trespass and an injunction. Defendant, an uphill landowner on a natural watershed, increased an

erted the flow of surface water over his land to the plaintiff's downhill land by constructing a ne patio with improper drainage and a water ffle. Plaintiff contended that an injunction was e proper remedy. Defendant contended that an ard of money to the plaintiff for construction of new drainage system on his property would be fficient to prevent future damage by diverting the jectionable surface flow. In partially reversing a wer court judgment, the Court of Appeals of aryland held that, although a judgment for mages was correct, an award of money to build a w drainage system was erroneous. A downhill downer is entitled to an injunction requiring hill landowners to prevent the further artificial crease and diversion of surface waters onto the wnhill land. The award to build a new drainage stem was unnecessary, as defendant should bear e burden of correcting the situation. (Smiljanich-orida)

ONSOULIN V SHELL OIL CO (ESTOPPEL BY ONTRACT AS APPLICABLE TO MINERAL ASES).
l Fed Supp 900-902 (WD La 1971).

escriptors: *Louisiana, *Leases, *Contracts, oyalties, Bayous, Beds under water, Water hts, Land tenure, Water allocation (Policy), ater distribution (Applied), Water contracts, creage, Land resources, Ownership of beds, nds, Exploitation, Payment, Mineralogy, Oil, Oil dustry, Gases, Gulf Coastal Plain, State governents, State jurisdiction, Judicial decisions, Legal pects.

aintiff landowner brought action to cancel a lease der which defendant oil company was granted neral rights in land. Plaintiff contended that dendant wrongfully allocated water bottom acreage the state and that plaintiff should therefore cover royalties paid to the state. Defendant conded that plaintiff had acceded to the original vision order allocating royalties to the state thout disputing the apportionment of acreage d was therefore estopped to assert that royalties om the water bottoms were wrongfully paid to the ate. In granting defendant's motion for summary dgment, the United States District Court for the estern District of Louisiana noted that on two occasions plaintiff had signed agreements allocating e water bottom acreage to the state. Defendant lied on these agreements and paid royalties acrding to their strict terms. The principle of estopl by contract is applicable to disputes over oil d gas leases and to inaccurate apportionment in vision orders. Plaintiff's proper remedy was an tion against the state for unjust enrichment. miljanich-Florida)

UBLIC WORKS FOR WATER, POLLUTION ONTROL, AND POWER DEVELOPMENT ND ATOMIC ENERGY COMMISSION APROPRIATION ACT, 1971.
ublic Laws No 91-439, 84 Stat 890, 11 US Code ong and Admin News, p 4100-4112 (1970). 13 p.

escriptors: *Government finance, *Water sources development, *Administrative agencies, Financing, Federal government, Legeslation, Administration, Grants, Projects, Pollution abatement, Water works, Water quality control, Rivers, arbors, Flood control, Beach erosion, Interstate ommissions, Waste treatment, Water conservaon, Planning, Hydroelectric plants, Hydroelectric ower, River basin commissions, Legal aspects.

ursuant to previous acts of Congress, money is erein appropriated for specific public works relatg to various agencies of government, including ublic works for water, pollution control, and ater quality administration. The Army Corps of ngineers is authorized to conduct specific civil nctions pertaining to rivers and harbors, flood ontrol, beach erosion, and related purposes. The Department of the Interior is appropriated funds necessary to carry out the Federal Water Pollution Control Act for grants to interstate agencies and for construction of waste treatment works. The Department is further appropriated funds necessary for studies of water conservation and development plans and for activities preliminary to the reconstruction or extension of existing projects. Specific projects relating to water resources are provided funds necessary for their continuation. Regional power administrations, independent river basin commissions, and the Water Resources Council also receive designated funds. The various agencies involved are restricted as to the use of appropriations. (Smiljanich-Florida)

EMERGENCY COMMUNITY FACILITIES ACT OF 1970.
Public Law No 91-431, 84 Stat 886, 11 US Code Cong and Admin News p 4095 (1970).

Descriptors: *Local government, *Community development, *Treatment facilities, *Grants, Legislation, Federal government, Urban renewal, City planning, Economics, Public utilities, Pollution abatement, Public health, Public benefits, Water resources, Financing, Economic impact, Unemployment, Employment opportunities, Cities, Social aspects, Legal aspects.

The Housing and Urban Development Act of 1965, Title VII, is herein amended to authorize appropriation of one billion dollars for grants under a specific section of that act. The act is also amended to extend dates in other sections. The changes are made pursuant to a finding by Congress that, because of a shortage of funds, a large number of local governments throughout the nation are unable to finance construction of vital and urgently needed public facilities. There is an immediate need for such facilities in order to provide basic safeguards for the well-being of the people of the United States, to check widespread pollution of irreplaceable water sources, and to provide a method of combatting rising unemployment. INTERSTATE COMMISSION ON THE POTOMAC RIVER BASIN--COMPACT.
Public Law No 91-407, 84 Stat 856, 11 US Code Cong and Admin News, p 4060-4065 (1970). 6 p.

Descriptors: *Interstate compacts, *Interstate rivers, *Interstate commissions, *River basin commissions, Water districts, State governments, Federal government, Maryland, West Virginia, Pennsylvania, Virginia, District of Columbia, River basins, Water resources development, Administrative agencies, Pollution abatement, River basin development, Water conservation, Project planning, Standards, Sewage treatment, Industrial wastes, Water quality, Classification, Legal aspects.
Identifiers: *Potomac River Basin.

Pursuant to a compact among the states of Maryland, West Virginia, Pennsylvania and Virginia, and the District of Columbia, Congress herein consents to the creation of the Potomac Valley Conservancy District and the Interstate Commission on the Potomac River Basin. The Commission shall have the power: (1) to collect, analyze and distribute data on pollution and other water problems of the Conservancy District and to sponsor research therein; (2) to cooperate with other agencies in formulating uniform rules and regulations concerning pollution abatement and water resources development; (3) to cooperate with public and non-public agencies in the formulation and coordination of plans and programs relating to pollution abatement and water resources development; (4) to make, revise, and recommend to the signatory parties reasonable minimum standards for the treatment of sewage and industrial wastes in the Conservancy District; and (5) to establish water quality standards satisfactory for various classifications of use. The signatory parties will formulate a classification of interstate waters for this last purpose. Provisions as to subsections of the committee and financing are set forth. Congress withheld consent from the provisions as to water quality standards and water classification. (Smiljanich-Florida)

WATER BANK ACT.

Public Law 91-559, 84 Stat 1468, 15 US Code Cong and Admin News, p 6666-6670 (1970). 5 p.

Descriptors: *Wetlands, *Wildlife habitats, *Flood control, *Water conservation, Watershed management, Contracts, Land tenure, Federal government, Legislation, Farms, Agricultural watersheds, Migratory birds, Waterfowl, Wildlife conservation, Adoption of practices, Land management, Land development, Erosion control, Surface runoff, Soil erosion, Wind erosion, Eminent domain, Legal aspects, Administrative agencies, Financing.
Identifiers: *Water Bank Act.

The Water Bank Act is hereby enacted in order to conserve surface waters, to preserve and improve habitats for migratory waterfowl and other wildlife resources, to reduce runoff, soil and wind erosion, to contribute to flood control, and to effect other purposes. The Secretary of Agriculture is authorized to enter into ten-year agreements with landowners and operators in certain wetland areas. The owner shall agree: (1) to place in the program eligible wetland areas he designates; (2) not to drain, burn, fill, or destroy the areas' wetland character, nor to use such areas for agricultural purposes; (3) to effectuate the wetland conservation and development plan for his land; (4) to forfeit all rights upon transfer of the land and to refund all payments upon violation of the agreement; (5) not to adopt practices defeating the purposes of the agreement; and (6) to follow necessary additional provisions the Secretary may adopt. In return, the Secretary shall: (1) make a fair and reasonable annual payment in consideration of the landowner's obligations, and (2) bear a portion of the cost of the conservation and development plan. Various administrative details are set forth. (Smiljanich-Florida)
W71-07444

SUSQUEHANNA RIVER BASIN COMPACT.

Public Law No 91-575, 84 Stat 1509, 15 US Code Cong and Admin News, p 6710-6748 (1970). 36 p.

Descriptors: *River basin commissions, *Interstate compacts, *Federal government, *River basin development, Interstate rivers, Water resources development, United States, Maryland, New York, Pennsylvnia, Legislation, Administrative agencies, Federal-state water rights conflicts, Area redevelopment, Planning, Water management (Applied), Water quality control, Water supply, Flood protection, Watershed management, Recreation, Hydroclectric power, Consumptive use, Diversion, Legal aspects.
Identifiers: *Susquehanna River Basin Compact.

By this act of Congress, the United States is made a signatory party to the Susquehanna River Basin Compact, set forth herein, with certain reservations. Because of the interstate and national interest in the water resources of the river basin area, the United States, Maryland, New York, and Pennsylvania agree to create a commission to provide central administration, and comprehensive planning and management. The commission is composed of the governor of each signatory state, or his designee, and one Presidential appointee. The commission may plan, construct, and operate any project necessary to the purposes of the Compact, establish water standards, collect data, and sponsor research. The commission shall plan and implement water resources projects, administer the basin water resources, and compel compliance with

the provisions of the Compact or regulations of the commission by court action. Areas over which the commission may exercise power include: (1) water supply, (2) water quality management and control, (3) flood protection, (4) watershed management, (5) recreation, (6) hydroelectric power, and (7) regulation of withdrawal and diversions. Provisions are made for financing and auxiliary powers. Congressional reservations as to specific provisions are set forth. (Smiljanich-Florida)

RIVERS AND HARBORS, FLOOD CONTROL ACTS OF 1970.

Public Law, No 91-611, 84 Stat 1818, 16 US Code Cong and Admin News, p 7824-7845 (1970). 22 p.

Descriptors: *Rivers and Harbors Act, *Flood control, *Engineering structures, *Water resources development, Legislation, Federal government, Administrative agencies, Legal aspects, Social aspects, Economic impact, Public benefits, Navigation, Erosion control, River basin development, Navigable rivers, Harbors, Adoption of practices, Federal budgets, Political aspects, Water conservation, Natural resources, Construction costs.
Identifiers: *Flood Control Act.

The construction, repair, and preservation of certain public works on rivers and harbors for navigation, flood control, beach erosion prevention, and other purposes is hereby authorized in the Rivers and Harbors, Flood Control Acts of 1970. The Secretary of the Army, acting through the Chief of Engineers, is authorized to prosecute the specified works in accordance with the plans recommended. The various projects and studies included, and the river basins involved, are set forth. The Secretary of the Army is to see that possible adverse economic, social and environmental effects relating to any proposed project have been fully considered and that the final decisions on the project are made in the best overall public interest. The Secretary must take into consideration the need for flood control, navigation, and the cost of eliminating or minimizing adverse effects such as water pollution, destruction of man-made and natural resources and esthetic values, and community or regional disruption. The objectives to be included in federally financed water resource projects are the enhancement of regional economic development, the quality of the total environment, the well-being of the people of the United States, and the national economic development. A MODERN PROPOSAL FOR STATE REGULATION OF CONSUMPTIVE USES OF WATER,
Frank E. Maloney, and Richard C. Ausness.
Hastings Law Journal, Vol 22, No 3, p 523-560, 1971. 158 ref.

Descriptors: *Administration, *Consumptive use, *Water utilization, *Permits, Regulation, Water rights, Prior appropriation, Riparian rights, Legislation, Legal aspects, Water supply, Water users, Water demand, Water resources, Administrative agencies, Water policy, Reasonable use, Beneficial use, Preferences (Water rights), Domestic water, Industrial water, Agriculture, Municipal water.
Identifiers: *Model Water Code.

Discussing a chapter from the draft Model Water Code, this article sets forth a proposed permit system regulating consumptive uses of water. The discussion is divided into five parts: (1) regulation of consumptive uses of water, (2) regulation under Eastern permit systems, (3) the constitutionality of legislation regulating water rights, (4) significant features of consumptive use permit systems, and (5) permits under the Model Water Code. The article first discusses the two doctrines governing water use: (1) the Eastern riparian system, and (2) the Western appropriation system. The riparian system should be modified because of its uncertainty and its lack of administrative controls, while the appropriation system is too rigid. Eastern permit systems are discussed cursorily, with emphasis on the Model Water Use Act and the Iowa Permit System. The article concludes that a modern interpretation of state police power would preclude constitutional challenges in most states. Important features of the Model Water Code are its reasonable-beneficial use standard, which seeks to prevent wasteful consumption of water, and the security provided water rights. In this latter regard the Code adopts a system of limited-term permits. Finally, the article sets forth the permit provisions of the Code with explanatory comment. (Duss-Florida)
W71-07481

A BILL TO PROVIDE FOR THE CONTROL AND PREVENTION OF POLLUTION, DETERIORATION OF WATER QUALITY, AND DAMAGE TO LANDS AND WATERS RESULTING FROM EROSION TO THE ROADBEDS AND RIGHTS-OF-WAY OF EXISTING STATE, COUNTY, AND OTHER RURAL ROADS AND HIGHWAYS.

Senate Bill 279, 92d Cong, 1st Sess (1971). 5 p.

Descriptors: *Bank stabilization, *Roadbanks, *Erosion control, *Sediment control, Soil conservation, Legislation, Federal government, State governments, Roads, Road construction, Drainage systems, Road design, Environmental engineering, Erosion, Bank erosion, Soil erosion, Damages, Sedimentation, Environmental effects, Disposition (Sediments), Sediment distribution, Channel erosion, Multiple-purpose projects, Administration, Cost sharing, Project planning.

Federal assistance in abating river and stream erosion and preventing erosion damage to rural roadbeds is proposed in this bill. The purposes of this bill include: (1) preservation of land and water resources, (2) maintaining water supply quality, (3) protecting fish and wildlife habitat and recreational values, (4) beautifying natural landscapes, (5) enhancing road safety, and (6) strengthening the rural economy. To carry out these policies the Secretary of Agriculture would be authorized to furnish financial assistance to state, county, and local agencies for the planning and installation of measures needed to prevent roadbed erosion. To prevent and control stream and river erosion and the accompanying damage to water and land resources, the Secretary would be authorized to: (1) assist states, counties, and local agencies--including soil and water conservation districts and nonprofit agencies--in formulating measures to prevent erosion and sediment damage; and (2) to assist in the implementation of such plans with financial, technical, or other assistance. As a condition to such assistance the state or agency must: (1) bear not less than twenty-five per cent of the costs; (2) acquire necessary land, easements, or rights-of-way; and (3) arrange for operational and maintenance costs. (Earl-Florida)
W71-07482

MARINE POLLUTION CONTROL ACT OF 1971 (A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT).
Senate Bill 192, 92d Cong, 1st Sess (1971). 6 p.

Descriptors: *Water pollution control, *Pollution abatement, *Legislation, *Permits, Disposal, Sea water, Waste disposal, Environmental sanitation, Garbage dumps, Sanitary engineering, Legal aspects, Sewage disposal, Ultimate disposal, Waste dilution, Waste assimilative capacity, Water quality control, Federal government, Administrative agencies, Administrative decisions, Regulation, Great Lakes, Ecology, Oceans, Coasts, Industrial wastes.
Identifiers: Federal Water Pollution Control Act.

This proposed amendment to the Federal Water Pollution Control Act would require a permit for the disposal of refuse into the Great Lakes, coastal waters, or high seas. Such permits, applicable to refuse material originating within the United States, would be granted by the Administrator of the Environmental Protection Agency. Upon receipt of permit applications, the Administrator would investigate the: (1) refuse's characteristics; (2) physical, biological, and ecological impacts of disposal; and (3) the proposed manner of disposal. A comprehensive report would then be prepared for inclusion in the record of one or more mandatory public hearings. After the closing of public hearings the Administrator would be required to make public written findings of fact, conclusions, and a decision. No decision granting a permit could be made without clear and convincing evidence that the disposal activity would not endanger: (1) public health, (2) plant or animal life, (3) physical processes, (4) food chains, or (5) marine ecology or environment. No decision granting a permit could become final absent affirmative concurrence by the Council on Environmental Quality. Temporary permits would be available where technical difficulties prevented the disposal of refuse in compliance with this bill. (Earl-Florida)
W71-07483

A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT.

Senate Bill 1012, 92d Cong, 1st Sess (1971). 12 p.

Descriptors: *Grants, *Water pollution control, *Legislation, *Financing, Federal government, Administration, State governments, Interstate, Interstate commissions, Interstate compacts, Pollution abatement, Administrative agencies, Capital supply, Waste treatment, Water purification, Water quality control, Water pollution treatment, Permits, Integrated control measures, Treatment facilities, Project planning, Cost repayment, Cost sharing, Costs, Administrative costs.
Identifiers: Federal Water Pollution Control Act.

A system of water pollution control grants and appropriations would be established under this proposed amendment to the Federal Water Pollution Control Act. Basic state water pollution control grants would be based upon: (1) population, (2) extent of pollution, and (3) financial need. Reasonable regulations would govern basic grants to interstate agencies. Administrative and personnel training costs could be included in basic grants. State or interstate agency plans would be eligible for approval if they: (1) provided for adequate administration; (2) contained reporting requirements; (3) set forth plans, policies, and methods; (4) contained extension or improvement provisions; (5) provided budgetary controls; and (6) contained acceptable priority criteria. Upon assurance that an improved water pollution control program was being developed, additional grants not exceeding twenty-five per cent of the state or agency's federal share, as defined by the amendment, could be provided. The elements of an improved program include: (1) a mandatory waste permit system, (2) a sewage treatment program, (3) personnel training programs, (4) recruitment programs, and (5) an adequate planning program. Bonus grants, not exceeding forty per cent of the federal share, could be provided upon a showing that one or more improved elements have been developed. Otherwise unexpended funds would be available for 'exceptional' programs. (Earl-Florida)
W71-07484

A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT TO PROVIDE FINANCIAL ASSISTANCE FOR RIVER BASIN PROGRAMS.

Senate Bill 601, 92d Cong, 1st Sess (1971). 4 p.

ernments, Participating funds, Reimbursable
ts, Specific costs, Water resources develop-
nt, Treatment facilities, Waste treatment, Water
lution control, Administration, Administrative
ts.
ntifiers: *Water Pollution Control Act.

roposed amendment to the Federal Water Pol-
on Control Act, this bill would authorize grants
ntrastate basin water quality management agen-
. Up to fifty per cent of agency administrative,
estigatory, operator training, and inspection
ts would be financed through such grants.
nts would beconditioned upon a determination
(1) consistency with applicable water quality
dards, (2) appropriate state approval, and (3)
e capability to execute plans. Interstate
rological units would be eligible with state
slative approval. Basin plans must provide com-
hensive water quality management, including:
waste-source control; (2) waste treatment
lity construction, operation, and maintenance;
flow control, diversion, or impoundment; and
waste treatment financing and cost distribution
niques. Basins include rivers or portions of
rs, streams, tributaries, coastal waters, sounds,
aries, ways, lakes and related land resources
ning a hydrological unit. Water and land situ-
d in a single metropolitan area are not eligible as
ins. Grants are not to exceed three years, but
y be renewed or extended. Agencies receiving
h grants shall not be eligible for other Federal
ter Pollution Control Act grants. (Earl-Florida)

llution abatement, *Legislation, Water policy,
ter pollution, Air pollution, Federal govern-
nt, State governments, Local governments, Ci-
, Water districts, Environment, Federal jurisdic-
n, State jurisdiction, Administrative agencies, In-
utions, Regulations, Industries, Standards, In-
state rivers, Legal aspects, Non-structural alter-
ives.

reased concern for environmental quality has
ulted in the creation of a diverse and complex
ly of laws, ordinances and regulations. A discus-
n of the laws and ordinances controlling pollu-
n in Illinois and the jurisdiction and interactions
the federal, state, and local agencies enforcing
m reveals the varied standards to which industry
d citizens are subjected. Federal standards and
forcement procedures are examined. The Illinois
vironmental Protection Act effected com-
hensive change upon Illinois pollution law by
ating centralized pollution control institutions.
e various functions of these institutions are
cussed, along with the enforcement of pollution
s. Powers of the state, counties, cities, and sani-
y districts often overlap. Cities, although without
clusive responsibility for regulation and enforce-
nt, can provide essential services in cases such
small or short-duration violations where it may
difficult or impossible to bring state investigative
wers to bear quickly. Industries under concur-
t pollution control of different agencies should
mply with the most rigorous regulation to which
y are subject. The Illinois Act and improved en-
cement have enhanced the prospects for a better
vironment. (Smiljanich-Florida)

E AREA OF ORIGIN AND A COLUMBIA VER DIVERSION,
lph W. Johnson.
ashington Law Review, Vol 46, No 2, p 245-281,
71. 128 ref.

scriptors: *Columbia River, *Columbia River
sin, *Inter-basin transfers, *Water transfer, In-
state rivers, Rivers, River basins, Basins, River basin development, River systems, Legal aspects, Diversion, Withdrawal, Planning, Water allocation (Policy), Water resources, Water resources development, Water utilization, Water supply, Water rights, Water sources.

A possible diversion of the Columbia River to the southwest is the subject of this article. The conflicts between area-of-origin protection and the needs of states out of the river basin are considered. The problem is discussed in light of problems which have arisen in California, Colorado, Nebraska, Texas, and Oklahoma. The following methods have been used to allocate interstate waters: (1) agreements between water users, (2) reciprocal legislation, (3) interstate compacts, (4) interstate litigation, and (5) congressional allocation. Congressional allocation is the most practical method, and congressional mandates in the area are superior to state regulations. A history of state and federal legislation is examined and evaluated in light of the possible diversion of the Columbia River. The author maintains that the Pacific Northwest should not continue total resistance to all studies dealing with diversion. If the water crisis continues in the Southwest, then Congress will probably enact a diversion statute with respect to which the Northwest may not have its interests fully protected. (Robinson-Florida)
W71-07487

SURFACE WATER IN SOUTH CAROLINA,
William T. Toal.
South Carolina Law Review, Vol 23, No 1, p 82-92, 1971. 76 ref.

Descriptors: *South Carolina, *Surface runoff, *Repulsion (Legal aspects), *Riddance (Legal aspects), Surface drainage, Water spreading, Surface waters, Drainage water, Overland flow, Storm runoff, Water sources, Runoff, Water law, Legal aspects, Damages, Compensation.

The law of surface waters in South Carolina is the subject of this note. There are three basic rules for the disposal of surface waters: (1) the common enemy rule, (2) the civil law rule, and (3) the reasonable use rule. South Carolina generally follows the common enemy rule, which allows every landowner to protect his porperty from surface waters even if he throws it back upon a coterminous landowner to his damage. However, landowners may not create a nuisance in disposing of surface waters. This exception has been very limited in use. Another exception is that a landowner cannot collect surface waters in an artificial channel and discharge it in concentrated form upon his neighbor's land. The author maintains that the rejection of negligence and reasonable use concepts is consistent with the common enemy rule but no longer makes any sense because South Carolina has become less agrarian. The South Carolina constitution provides that private property shall not be taken for public use without compensation. This clause has been used to hold the state liable for damages caused by the state with surface waters. (Robinson-Florida)

Notice is hereby published of a proposed agreement received from the Governor of Maryland which provides for the assumption of certain of the Atomic Energy Commission's authority pursuant to section 274 of the Atomic Energy Act. The Commission herein publishes a proposed memorandum of understanding between the State of Maryland and the Commission which would accompany the agreement. The memorandum is drafted to facilitate agreement with the state, pending resolution of the jurisdictional issue raised by the Maryland Department of Water Resources in attempting to impose limits upon radionuclide concentrations in liquid wastes discharged by a Baltimore Gas and Electric Company's nuclear power station. The proposed agreement would give the state regulatory authority over the disposal into the ocean or sea of byproducts, sources, or special nuclear waste materials. The proposed memorandum specifies that nothing therein nor in the proposed agreement shall affect their respective legal position on the question raised by the Maryland Department of Water Resources. PUBLIC USE OF CERTAIN LAKE AND RESERVOIR AREAS.
Corps of Engineers, Washington, D.C.

Federal Register, Vol 36, No 45, p 4494-4498, Saturday, March 6, 1971.

Descriptors: *Lakes, *Reservoirs, *Recreation, *Regulation, Public benefits, Boating, Camping, Fishing, Hunting, Swimming, National parks, Recreation facilities, Water policy, Boats, Federal government, Administration.

Regulations are promulgated by the Corps of Engineers for public use of lakes and reservoirs in the states of: Arkansas, California, Colorado, Connecticut, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Maryland, Massachusetts, Mississippi, Missouri, Montana, Nebraska, New Hampshire, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Vermont, Virginia, Washington, and West Virginia. Specific sites are listed in each state, and the following subjects are regulated: boating, swimming, hunting and fishing, camping, picnicing, access to public waters, destruction of public property, use of firearms and explosives, gasoline storage, sanitation, advertisements, solicitation for business, commercial operations, recreational activity programs, abandonment of personal property, discrimination, control of animals and pets, visiting hours, noise, and vehicles. SALINE WATER CONVERSION PROGRAM--APPROPRIATION.
HR Rep No 858, 91st Cong, 2d Sess, 4 US Code Cong and Admin News, p 764-769, 1970. 6 p.

Descriptors: *Saline water, *Desalination, *Desalination plants, *Legislation, Federal government, Administrative agencies, Administration, Budgeting, Financing, Government finance.

The legislative history of Public Law 91-221, an appropriations measure for the saline water conversion program, is set forth in this House report. The stated purpose of the bill is to authorize appropriations for continuance of the desalting research program of the Department of the Interior. Federal activity in the area began in 1952. The program has enlarged in scope and duration, and annual appropriations are now required. The present bill is the second annual appropriation. Committee amendments: (1) reduced the authorization by $500,000, (2) conveyed limited authority for foreign research, (3) deleted changes in the basic act, and (4) provided technical and clarifying language. Categories of activities for which expenditures have been established are: (1) research and development--$16,650,000; (2) development of

saline water conversion test beds--$5,000,000; (3) development of saline water conversion modules--$5,345,000; and (4) administration and coordination--$2,378,000. The report expresses confidence in the present management of the saline water conversion program, resulting from prudent utilization of prior appropriations and the achievement of discernable results. (Hart-Florida)

WATER AND ENVIRONMENTAL QUALITY IMPROVEMENT ACT OF 1970.
Conf Rep No 940, 91st Cong, 2d Sess, 4 US Code Cong and Admin News, p 830-868, 1970. 39 p.

Descriptors: *Water qulaity control, *Environment, *Administrative agencies, *Pollution abatement, Pollutants, Oil, Oil industry, Water pollution, Water pollution control, Water pollution sources, Water quality, Administration, Federal government, United States, Ships, Sewage, Sewage disposal, Legislation, Ecology, Legal aspects, Alaska.
Identifiers: *Water and Environ. Quality Improv. Act.

Since the Senate and House of Representatives disagreed as to an amendment to the Federal Water Pollution Control Act, called the Water and Environmental Quality Improvement Act of 1970, a joint conference was held to draft a mutually-agreeable amendment. The House bill, Senate amendment, and compromise substitute provisions for control of pollution by oil are discussed first. The counterpart House, Senate, and compromise solutions to the following problem areas are set forth and cover: (1) control of hazardous polluting substances; (2) control of sewage from vessels; (3) area acid and other minewater pollution control demonstrations; (4) pollution control in the Great Lakes; (5) training grants and contracts; (6) Alaska village facilities; (7) cooperation by federal agencies in the control of pollution; (8) awards for excellence; (9) research, investigations, training, and information; (10) Oil Pollution Act of 1924; (11) financing study; (12) name change; (13) reimbursement; (14) navigation; and (15) environmental quality. (Hart-Florida)

THE LAW OF WATER USAGE,
Charles W. Wixon, and Karl F. Zeisler.
In: Industrial Uses of Water in Michigan, p 102-136, Bureau of Business Research, University of Michigan, Ann Arbor, 1966. 1 tab, 25 ref.

Descriptors: *Michigan, *Reasonable use, *Prior appropriation, *Consumptive use, Water Quality Act, Water Resources Planning Act, Rivers and Harbors Act, Legislation, Water rights, United States, Federal jurisdiction, Federal-state water rights conflicts, Waste disposal, Water users, Water pollution, Judicial decisions, Riparian rights, Artificial use, Pollution abatement, Remedies, Nuclear wastes, Administrative agencies, Legal aspects, Water law.

This discussion of water law and legislation in the United States, and specifically Michigan, reveals the weaknesses of the present situation. Federal jurisdiction has been extended over all navigable waters, thus creating federal-state conflicts. The federal Water Quality Act and Water Resources Planning Act have created mixed fears among the states, especially as to the former. While federal law deals with disposal of water wastes, state laws cover rights to use water. These state laws, based largely on common law, are not clear. There are few Michigan statutes in the area. The two basic common law doctrines in the United States are the Eastern reasonable use doctrine, applicable in Michigan, and the Western prior appropriation doctrine. A discussion of their differences points to the inherent weaknesses of the reasonable use doctrine. The larger the user or the number of users, the weaker is the law. Legislation and water laws of other states are discussed. Water law must be put on a statutory basis, as the common law has led to many unsolved problems. The Model Water Act provides a flexible starting point for the task. (Smiljanich-Florida)
W71-07493

OIL POLLUTION OF COASTAL AND INLAND WATERS OF THE UNITED STATES UNDER THE WATER QUALITY IMPROVEMENT ACT OF 1970,
Alfred A. Lohne.
Insurance Counsel Journal, Vol 38, No 1, p 49-62, 1971. 73 ref.

Descriptors: *Oil wastes, *Accidents, *Water pollution control, *Pollution abatement, Damages, Oily water, Water pollution sources, Water pollution treatment, Oil, Ships, Federal government, Legislation, Legal aspects, Remedies, Water pollution, Water pollution effects, Jurisdiction, Rivers and Harbors Act.
Identifiers: *Water Quality Improv. Act.

Oil pollution of coastal and inland waters, as affected by the Water Quality Improvement Act of 1970, is the central topic of this article. Discussed as the background for the Water Quality Improvement Act are: (1) the Water Pollution Act of 1886, (2) the River and Harbor Act of 1899, (3) the Oil Pollution Act of 1924, (4) the Oil Pollution Act of 1961, and (5) the 1966 Clean Water Restoration Act. The Water Quality Improvement Act provides for: a National Contingency Plan, a basis and amount of liability, claims against the United States, jurisdiction, evidence of financial responsibility, direct suits against underwriters, and offshore rigs. The Act does not concern private suits, but the National Contingency Plan will greatly assist private landowners in cleaning their lands and waters. While the Act will not prevent all accidents, it provides measures for a rapid cleanup at the expense of the polluter. These expenses will be recoverable in the appropriate district court. There are four exceptions to the strict liability of the polluter: (1) an act of God, (2) an act of war, (3) negligence on the part of the United States, and (4) an act or omission of a third party. ECONOMIC AND INSTITUTIONAL ASPECTS OF WATER TRANSFERS IN NORTHWEST NEVADA,
Nevada Univ., Reno. Dept. of Agricultural and Resource Economics.
John G. McNeely.
Agricultural Experiment Station Report B27, Jan 1971. 29 p, 12 tab, 1 fig, 27 ref.

Descriptors: *Water transfer, Inter-basin transfers, Water users, *Appropriation, Water rights, *Institution, Evaluation, *Nevada.
Identifiers: *Truckee River Basin, Truckee-Carson Irrigation District, Sierra Pacific Power Company.

Although the author describes how Nevada's ap propriative type of water law has worked relativel well, he states that 'it would be erroneous to cor clude that its operation cannot be improved.' B focusing on the Truckee River Basin i northwestern Nevada he was able to study specif cally how water rights have been transferred fro one use to another in Nevada and the role that leg and institutional arrangements have played in thes transfers. Since 1944, the author stated, 18,32 acre-feet of water transfers have taken place on th Truckee River, representing primarily change from irrigation to municipal and industrial uses. H concludes that if improvements in Nevada's leg and institutional arrangements were made, such a enforcement of Nevada's law regarding non-use water, non-transferability of Newland Proje water and offering incentives for more efficient us of water, increased water transfers could take plac and the economy of the Truckee River Basin cou gain increased benefits. EFFICIENT DISTRIBUTION OF RESOURCE THROUGH THREE LEVELS OF GOVERN MENT,
Dalhousie Univ., Halifax (Nova Scotia); and Tex Univ., Austin, Tex.
R. M. Cassidy, M. J. L. Kirby, and W. M. Raike.
Management Science, Vol 17, No 8, B462-B47 Apr 1971.

Descriptors: *Resource allocation, Decision-ma ing, Economic efficiency, Cost, Budget constrain Dynamic programming, Cost.
Identifiers: *Algorithm, Objective functio Parametric statistics, Matrix.

This paper presents a model for determining how central government or authority can most ef ciently allocate resources among other levels government. The model takes into account bo the initial allocation by the higher level governme body and the usage of resources that is determin by the lower level unit. A key feature of the mod is the mathematical formulation of the cent government's objective of distributing resources ficiently while at the same time being as fair possible to all those receiving allocations. T authors then propose a solution technique whi uses either parametric analysis or dynamic pr gramming. Illustrative examples are given to clari the model and the solution approach. This article relevant to water research concerned with inte governmental budgetary relations and resource location. (Siegenthaler-Rutgers)

ATER RESOURCES ACTIVITIES IN THE
ITED STATES-POLLUTION ABATEMENT.

nate Select Comm on National Water Resources,
es 48, 86th Cong, 2d Sess (1960). 38 p, append.

scriptors: *Water pollution sources, *Water pol-
ion effects, *Domestic wastes, *Industrial
stes, Water pollution, Organic wastes, Sewage
posal, Wastes, Waste treatment, Water pollution
atment, Water quality, Sewage disposal, Mu-
ipal wastes, Sewage, Waste water (Pollution),
llutant identification, Organic acids, Inorganic
mpounds, Organic pesticides, Thermal pollution,
llutants, Pollution abatement, Radioactive
stes, Radioactive waste disposal, Groundwater.

ater polluting substances are classified and
cussed in eight general categories: (1) oxygen
manding wastes, including sewage; (2) infectious
nts; (3) plant nutrients; (4) organic chemical
otics including detergents and pesticides; (5)
ner chemical and mineral substances; (6) sedi-
nts; (7) radioactive substances; and (8) heat.
ecial problems involving all categories are
cussed with relation to industrial and municipal
stes, with emphasis on the effects of pollutants
potential uses of the affected waters, problems
groundwater pollution and the effects of such
llution on future water needs. Numerous charts
d tables illustrate pollutant loads, waste treat-
nt and pollution elimination costs projected to
e year 2000, and prevalence of various pollutants
different areas. Appendices treat pollution-re-
cd subjects in thirteen water resources regions.

ater, long considered plentiful, is becoming so
arce as to require a means of allocation. Since
ter has not been subject to private ownership,
d there has been no general supervision of water
age, the problems of water allocation are more
mplex than with other commodities. The solu-
ns most often proposed for water allocation are:
) regulations imposed by governments for water
e; (2) subsidies to be granted to firms and mu-
cipalities for the removal of wastes which lower
ter quality; and (3) a tax or effluent charge
ied on wastes discharged into streams or other
dies of water. Evaluation of these proposals in-
cates that, although regulations could provide for
timum economic water use, they have not ac-
mplished that objective. Despite the assertion
at effluent charges are licenses to pollute, such
arges do not license the unlimited discharge of
llutants, but of only specified amounts. Subsidies
r pollution abatement, since financed by all tax-
payers, are the most just means of water allocation and pollution control. (Hart-Florida)

Identifiers: *Environmental geology.

The contributions of the earth scientist to environmental problem solving are discussed under five general categories. The first of these is collecting data for planning the proper use of the terrane, or the most efficient adjustment of man's use of the earth's surface to all of the physical features and characteristics at and below the surface - particularly in expanding urban areas. Second is determination of the factors that influence the safety and permanence of disposal of waste materials and trash of all kinds - both in the rocks near the surface and at great depth in mines and wells. Third is providing information for the planning and development of safe, adequate, and continuing water supplies in locations that will serve populated areas. Fourth is the identification of rock and mineral resources to provide for future availability of needed raw materials, or of appropriate substitute materials. And, fifth is the recognition of man as a major geologic agent by monitoring the changes he has caused in his environment and by providing remedies where these changes are, or may become, harmful. 07. RESOURCES DATA

7A. Network Design

A PROPOSED STREAMFLOW DATA PROGRAM FOR ARKANSAS,
Geological Survey, Little Rock, Ark.
James L. Patterson.
Geological Survey Open-file Report, 1969. 43 p, 3 fig, 4 tab, 6 ref, append.

Descriptors: *Streamflow, *Network design, *Data collections, *Arkansas, Planning, Hydrologic data, Stream gages, Regression analysis, Natural flow, Regulated flow, Surface waters, Gaging stations.
Identifiers: Streamflow-data evaluation.

An evaluation of the streamflow data available in Arkansas was made to provide guidelines for planning future programs. The basic steps in the evaluation procedure were (1) definition of the long-term goals of the streamflow data program in quantitative form, (2) examination and analysis of all available data to determine which goals have already been met, and (3) consideration of alternate programs and techniques to meet the remaining objectives. Many of the goals could be met by generalization of the data for gaged basins by regression analysis. Changes can be made in the present data program to attain the goals that have not been met. A streamflow data program, based on the guidelines developed, is proposed. (Woodard-USGS)
W71-07254

A PROPOSED STREAMFLOW DATA PROGRAM FOR PENNSYLVANIA,
Geological Survey, Harrisburg, Pa.
Leland V. Page.
Pennsylvania Department of Forests and Waters Technical Bulletin No 3, 1970. 55 p, 3 fig, 4 tab, 10 ref, append.

Descriptors: *Streamflow, *Network design, *Pennsylvania, *Data collections, Reviews, Planning, Stream gages, Natural flow, Regulated flow, Hydrologic data, Gaging stations, Flow characteristics.
Identifiers: *Streamflow characteristics.

An evaluation of the streamflow data available in Pennsylvania was made to provide guidelines for planning future programs. The basic steps in the evaluation procedure were (1) definition of the long-germ goals of the streamflow-data program in quantitative form, (2) examination and analysis of all available data to determine which goals have already been met, and (3) consideration of alternate programs and techniques to meet the remaining objectives. It was found that many of the goals could be met by generalization of the data for gaged basins by regression analysis. A stream-flow-data program based on the guidelines developed in this study is proposed. The current network is reasonably comprehensive but additional stations are needed to better define the limestone-sandstone index. (Woodard-USGS)
W71-07299

A PROPOSED STREAMFLOW DATA PROGRAM FOR MARYLAND AND DELAWARE,
Geological Survey, Towson, Md.
William E. Forrest, and Patrick N. Walker.
Geological Survey Open-file Report, 1970. 41 p, 1 fig, 8 tab, 6 ref, 1 plate, append.

Descriptors: *Streamflow, *Network design, *Data collections, *Maryland, Planning, Hydrologic data, Stream gages, Regression analysis, Flow characteristics, Natural flow, Regulated flow, Gaging stations.
Identifiers: Streamflow-data evaluation, Streamflow characteristics.

An evaluation of the streamflow data available in Maryland and Delaware provides guidelines for planning future programs. The basic steps in the evaluation procedure were (1) definition of long-term goals of the streamflow data program in quantitative form, (2) examination and analysis of all available data to determine which goals have already been met, and (3) consideration of alternate programs and techniques to meet the remaining goals. Although most of the goals were not met by generalization of the data for gaged basins by regression analysis, it is still possible to make significant changes in the present data program to assist in attaining the goals. A streamflow data program based on the guidelines developed is proposed for the future. (Woodard-USGS)
W71-07300

A PROPOSED STREAMFLOW DATA PROGRAM FOR MINNESOTA,
Geological Survey, St. Paul, Minn.
William B. Mann, IV, and Charles R. Collier.
Geological Survey Open-file Report, Sept 1970. 75 p, 4 fig, 8 tab, 10 ref.

Descriptors: *Streamflow, *Network design, *Data collections, *Minnesota, Planning, Hydrologic data, Stream gages, Regression analysis, Flow characteristics, Natural flow, Regulated flow, Gaging stations.
Identifiers: Streamflow-data evaluation.

An evaluation of the streamflow data in Minnesota provides guidelines for planning future programs. The principal steps in this evaluation were (1) establishing the objectives and goals of the program, (2) examining and analyzing all available data to determine which of the goals have been met, (3) considering alternate means of meeting the remaining goals, and (4) identifying elements that should be included in the future program. Regression analysis of generalized data did not meet the established accuracy criteria. Significant changes must be made in the present data-collection program to meet these goals. Analysis on a regional basis is one way in which the accuracy can be improved. There are 105 current-purpose stations which should be continued as well as 137 crest-stage partial-record stations and about 400 low-flow sites. Seven minor stream-gaging stations and 13 natural-flow, principal-stream stations are recommended for discontinuance. Establishment of 53 new gaging stations is recommended. (Woodard-USGS)
W71-07301

A PROPOSED STREAMFLOW-DATA PROGRAM FOR MONTANA,
Geological Survey, Helena, Mont.
F. C. Boner, and G. W. Buswell.
Geological Survey Open-file Report, 1970. 96 p, 4 fig, 9 tab, 16 ref.

Descriptors: *Streamflow, *Network design, *Data collections, *Montana, Planning, Hydrologic data, Stream gages, Regression analysis, Natural flow, Regulated flow, Surface waters, Gaging stations.
Identifiers: Streamflow characteristics, Data evaluation.

An evaluation of the streamflow data available in Montana was made to provide guidelines for planning future programs. The basic steps in the evaluation procedures were (1) definition of the long-term goals of the streamflow data program, (2) examination and analysis of all available data to determine which goals have already been met, and (3) consideration of alternatate programs and techniques to meet remaining goals. Only one of the goals was met by generalization of the data for gaged basins by regression analysis. The regression method may be more successful at a future time if a more suitable model can be developed, and if an adequate sample of streamflow records can be obtained. In the meantime, other methods of transferring flow characteristics which require some information at the ungaged site may be used. A streamflow data program, based on the guidelines developed, is proposed. (Woodard-USGS)

MEASURING THE HYDRAULIC POTENTIAL OF GROUNDWATER WITH THE HYDRAULIC POTENTIAL PROBE,
Grontmij N.V., Bilt (Netherlands).
B. Fokkens, and J. Weijenberg.
Journal of Hydrology, Vol 6, No 3, p 306-313, 1968. 8 p, 3 fig, 2 tab, 2 ref.

Descriptors: *Piezometers, *Groundwater movement, *Saturated soils, *Hydraulic conductivity, *Potentiometers, Methodology, Testing, Test procedures, Soil moisture meters, Manometers, Moisture tension.
Identifiers: *Hydraulic potential probe.

The 'potential probe' is a new instrument to measure hydraulic potentials in saturated soils, without disturbing the soil profile. The basic lag time of the apparatus is about 15 times shorter than that of normal one-inch-tube piezometers. A hollow steel needle with an outer diameter of 2 mm is connected with a manometer. This is the measuring needle which is closed at the lower end and provided with an opening one cm above the bottom. A mantle needle around the measuring needle can be moved over this opening. The manometer is made of a plastic laboratory tube with an inner diameter of 2 mm. This manometer can be closed at the upper end with a clip. The manometer is fitted on a lath which is clenched to a rod. This rod is pressed into the soil. The length of the measuring needle and the height of the manometer are 100 cm. The operation of the instrument is explained, and the data obtained are given. (Woodard-USGS)

DEVELOPMENT OF A STATEWIDE SYSTEM FOR COMPUTER PROCESSING OF HYDROGEOLOGICAL DATA,
Montana Bureau of Mines and Geology, Butte.
M. K. Botz.
Available from Montana Bureau of Mines and Geology 203-B Main Hall, Montana College of Mineral Science and Technology, Butte, Montana 59701. Montana Bureau of Mines and Geology Special Publication 49, 1970. 35 p, 3 fig, 2 tab, 25 ref. OWRR Project A-014-MONT (1).

Descriptors: *Montana, *Data processing, *Data storage and retrieval, *Hydrologic data, Hydrogeology, Water quality, Computer programs,

Digital computers, Planning, Water management (Applied).
Identifiers: *Hydrogeological data processing.

Numerous computer-oriented data-processing systems used to store, retrieve, and manipulate hydrogeological data are reviewed for their suitability for use in Montana. The US Geological Survey and the Canadian government have developed nationwide groundwater data-processing systems. The Federal Water Pollution Control Administration STORET system, systems used by the oil industry, and systems used in other states also may be of use in the development of a statewide groundwater data-processing system. Of the available processing systems, the US Geological Survey system is the most nearly complete and most useful for statewide use, but even this system is too limited in scope and flexibility. Planning and development of a comprehensive statewide hydrogeological data-processing system requires a computer facility, considerable funds, and skilled personnel. (Knapp-USGS)

ANNUAL COMPILATION AND ANALYSIS OF HYDROLOGIC DATA FOR DEEP CREEK, COLORADO RIVER BASIN, TEXAS, 1969,
Geological Survey, Austin, Tex.
H. R. Hejl, Jr.
Geological Survey Data Report, Feb 1971. 73 p, 2 fig, 3 tab.

Descriptors: *Rainfall-runoff relationships, *Streamflow, *Hydrologic data, *Colorado River basin, *Texas, Data collections, Flood control, Control structures, Stream gages, Flow characteristics, Gaging stations, Hydrographs, Surface waters, Mass curves.
Identifiers: *Deep Creek (Tex), Water budget.

This report contains the rainfall, runoff, and storage data collected during the 1969 water year (Oct. 1968-Sept. 1969) for the 43.9-square-mile area above the stream-gaging station Deep Creek near Mercury, Texas, and the 8.31-square-mile area above the stream-gaging station Dry Prong Deep Creek near Mercury, Texas. Six floodwater-retarding structures have been completed in the watershed. Five of these structures are upstream from the stream-gaging station Deep Creek near Mercury. They have a combined capacity of 5,600 acre-feet and regulate floodflow from 19.9 square miles (45%) of the drainage area above the stream-gaging station. The other structure is above the stream-gaging station Dry Prong Deep Creek near Mercury. It has a floodwater-retarding capacity of 1,370 acre-feet and regulates floodflow from 5.41 square miles, or approximately 65% of the drainage area above the stream-gaging station. The weighted-mean rainfall over the Deep Creek area was 30.79 inches and over the Dry Prong Deep Creek area was 30.26 inches. The ratio of rainfall to runoff ranged from 3.9 to 5.7% for the stations with continuous recording gages. (Woodard-USGS)

HYDROGRAPHIC OBSERVATIONS ON TH RED SEA BRINES INDICATE A MARKED IN CREASE IN TEMPERATURE,
Woods Hole Oceanographic Institution, Mass.
P. G. Brewer, T. R. S. Wilson, J. W. Murray, R. G. Munns, and C. D. Densmore.
Nature, Vol 231, No 5297, p 37-38, May 7, 1971. p, 1 fig, 1 tab, 13 ref.

Descriptors: *Sea water, *Water temperatur *Water chemistry, *Brines, *Data collection Ships, Analytical techniques, Salinity, Iron, Ma ganese.
Identifiers: *Red Sea, Atlantis II.

The bathymetric and hydrographic data from th expedition of the R/V Chain during Novemb 1966 revealed three deeps in the Red Sea all co taining hot brine. During February 1971, R/ Chain revisited the brine area. The most unusu observation is that the temperature of the Atlan II brine has risen 2.7 deg C from 56.5 deg C to 59 deg C in the 51 months since the last published o servation. For the 1971 cruise, special high ran protected thermometers were used, and it is es mated that these observations were accurate about 0.05 deg C. The interface between the deg C brine and the intermediate brine seems have risen by about 6 m since 1966, giving an crease in volume of this brine of about 12%. No s nificant change was detected in the salinity of t deep Atlantis II brine. Observed increase in d solved iron and manganese indicates that over t period of observation, the rate of input of these e ments in the reduced form has greatly exceeded t rate of deposition of the oxidized form. (Wooda USGS)

DROLOGIC SETTING OF DEER POINT KE NEAR PANAMA CITY, FLORIDA,
ological Survey, Tallahassee, Fla.
H. Hughes.
rida Bureau of Geology Map Series No 38, 70. 1 Sheet, Text, 5 fig, 1 map, 2 tab, 11 ref.

scriptors: *Hydrologic data, *Lakes, *Florida, ter quality, Inflow, Water levels, Rainfall, Air perature, Water temperature, Water resources, mical analysis, Water utilization, Evaluation, face waters, Surface-groundwater relationships, a collections, Water quality, Water supply.
ntifiers: *Deer Point Lake (Panama City, Fla), drologic Atlas.

er Point Lake was formed in 1961 by construc- of a low-head causeway dam across the thern part of North Bay at Deer Point about 8 es north of Panama City, Fla. The lake provides mple water supply for the continued economic wth of the Panama City area and adds to the reational facilities available for tourists and re-nts of that area. During 1968 the total water ndrawn from Deer Point Lake for municipal and ustrial use averaged about 40 mgd, or slightly than 15% of the streamflow that entered th during the 1968 drought. Chemical analyses of er taken from the lake the day before the dam was closed showed that the concentrations of chloride averaged about 11,000 mg/liter. Because of mixing of the saline lake water with the large throughflow of fresh water, the average concentration of chloride was reduced to less than 400 mg/liter within 3 months after dam closure and to less than 40 mg/liter within a year. This one sheet atlas contains tables and illustrations of data concerning water quality, streamflow entering the lake, lake water levels, rainfall, air temperature, and water temperature. WATER WAVES GENERATED BY LANDSLIDES,
Asian Inst. of Tech., Bangkok (Thailand).
E. Noda.
Proceedings American Society of Civil Engineers, Journal of the Waterways Harbors and Coastal Engineering Division, Vol 96, No WW4, p 835-855, Nov 1970. 21 p, 12 fig, 2 tab, 9 ref, 2 append.

Descriptors: *Waves (Water), *Landslides, Dam design, Reservoirs, Wave height, Coastal engineering, Earthquakes, Tsunamis, Bank stability, Two-dimensional, Analytical techniques, Solutions, Equations, Theory, *Wave generation, Comparative studies, Experimental data, Numerical analysis, Shores, Foreign research.
Identifiers: Empirical methods, Thailand.

The problem of water waves generated by landslides along coastlines or in enclosed bodies of water is of great practical interest to design engineers when geological factors predict the possibility of a landslide. Two distinct types of landslide are considered--vertical and horizontal. The vertical landslide is modeled by a 2-dimensional box falling vertically. The horizontal landslide is modeled by a 2-dimensional wall that moves into the fluid domain. Theoretical solutions are obtained, assuming that the geometric and dynamic parameters of the problem are known. Graphs are presented for motion with constant velocity. Results of experiments to verify the vertical landslide theory compare favorably in the region where linearized theory is valid. An approximate method is developed to find the amplitude of the largest wave in the nonlinear region by utilizing the solutions obtained from linear theory for vertical landslides. The approximate method is applied to the Lituya Bay, Alaska landslide of July 9, 1958, to estimate the largest wave. (USBR)

LOCK AND DAM NO. 13, ARKANSAS RIVER NAVIGATION PROJECT; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. J. Franco, and L. J. Shows.
Sponsored by US Army Engineer District, Little Rock. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-8, July 1970. 19 p, 6 tab, 25 pl.

Descriptors: *Locks, *Hydraulic models, Dams, Navigable rivers, Dikes.
Identifiers: *Navigation dams, *Lock and Dam No 13 (Arkansas River Project), Arkansas River Navigation Project, Navigation conditions, Revetments.

Lock and Dam No. 13 is proposed for construction on the Arkansas River about 7 miles downstream of Van Buren, Ark. Model investigation was concerned with the study of navigation conditions in the approaches to the lock to determine the effects of the proposed regulating structures on channel development in the reaches upstream and downstream of the structure and with the development of measures required to overcome or minimize the effects of any adverse conditions. An undistorted, semifixed-bed, 1:120-scale model reproduced about 7.4 miles of the Arkansas River and additional bank area. The results of the investigation indicated the need for modifications in the regulating structures to improve navigation conditions through the reaches upstream and downstream of the lock. Conditions in the bend and in the crossing downstream can be improved by raising the elevation of the dikes and revetment farther downstream to head of crossing. Construction of a wing dike would reduce frequency of maintenance dredging. (Franco-WES)

LOCK AND DAM NO. 14, ARKANSAS RIVER NAVIGATION PROJECT; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. J. Franco, and L. J. Shows.
Sponsored by US Army Engineer District, Tulsa. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-71-1, Feb 1971. 33 p, 6 tab, 5 photo, 31 pl.

Descriptors: *Locks, *Hydraulic models, Dams, Navigable rivers.
Identifiers: *Navigation dams, *Lock and Dam No 14 (Arkansas River Project), *Arkansas River Navigation Project, *Navigation conditions.

Project will provide a navigable pool extending upstream about 20 miles to the Robert S. Kerr Dam. The investigation, concerned with the study of navigation conditions in the approaches to the lock with the proposed design and with the development of modifications required to produce adequate channel depths and to overcome or minimize the effects of any adverse navigation conditions, was

conducted on an undistorted, 1:120-scale, semifixed-bed model, reproducing about 3.4 miles of the Arkansas River and adjacent overbank area. Results indicate that: because of location of lock with respect to the bend upstream, navigation conditions for downbound tows approaching lock would tend to be difficult and hazardous; satisfactory navigation conditions can be developed by modification of existing structures and realignment of right bank upstream of the lock; because of the training structures required to develop adequate channel depths and currents satisfactory for navigation, velocities in reaches just upstream and downstream of dam will tend to be high during high flows; velocity of currents affecting navigation in lower approach can be reduced by excavation of channel downstream of the spillway; and shoaling in the lower lock approach will be a problem. (Franco-WES)
W71-07175

CALCASIEU SALTWATER BARRIER, PROTOTYPE SECTOR GATE TESTS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
D. F. Bastian.
Sponsored by US Army Engineer District, New Orleans. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Miscellaneous Paper H-71-4, Feb 1971. 14 p, 1 tab, 10 pl.

Descriptors: *Barriers, *Prototype tests, *Gates, *Saline water intrusion.
Identifiers: *Calcasieu Saltwater Barrier, *Sector gates, Navigation structures.

Prototype tests were conducted on the sector gate at the Calcasieu Saltwater Barrier navigation structure in March 1970. The controlled variables were the rate of gate openings and the differential reverse head. Prototype tests showed that the hydrodynamic and friction forces were much greater than anticipated in the design. The prototype data agreed reasonably well with the model data of a similar gate. DEVELOPMENT OF NAVIGATION AT LOCK AND DAM NO. 17, ARKANSAS RIVER PROJECT; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. J. Franco, J. E. Glover, and B. K. Melton.
Sponsored by US Army Engineer District, Tulsa. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-12, Sept 1970. 21 p, 19 pl.

Descriptors: *Locks, *Hydraulic models, Dams, Navigable rivers, Gates.
Identifiers: *Navigation dams, *Lock and Dam No 17 (Arkansas River Project), *Arkansas River Navigation Project, Navigation conditions, Verdigris River, Tainter gates.

Lock and Dam No. 17 will comprise a nonnavigable gated dam with three 61-ft-wide by 27-ft-high tainter gates 9.8 miles above the confluence of the Arkansas and Verdigris Rivers, and a 110- by 600-ft lock located about 0.6 mile east in an excavated, slack-water navigation canal. Two 1:120-scale fixed-bed models, reproducing about 1.8 mi of upper and about 2.1 mi of lower reaches of the river channel and the slack-water navigation canal, were used to study navigation conditions at the upstream and downstream entrances to the navigation canal, and to determine flow conditions that could be expected near the entrances to the slack-water canal and through existing and proposed bridges and the modifications required to produce satisfactory navigation conditions through the reach. Results of the investigations are given. (Spivey-WES)

ENGINEERING A HOLE IN THE GROUND.
Hawthorne, Inc., Houston, Tex.

Bulletin No S, EH-656, 756, 856, 956 and 1056, 1964. 24 p, 33 fig.

Descriptors: *Drilling, *Water wells, Drilling equipment, Drilling fluids, Wells, Pump, Mud, Gravels.
Identifiers: *Shot-hole drilling, Hole size, Bitsize, Annulus area, Up-hole velocity, Hole fluid requirements, Bit penetration vs. rotary speed, Jet drilling, Horsepower requirements, Drilling mud functions, Lost circulation, Gravel drilling, Crooked holes, Reaming stabilizer.

The characteristic problems related to drilling relatively small diameter holes are generally quite similar. The basic objective is fundamentally economic - to produce the maximum hole at minimum competitive cost for equipment and labor, and to provide a reasonable footage price to the customer and reasonable footage profit to the contractor. The booklet covers the general characteristics of shot hole drilling problems in some depth with abundant figures and sparse references. (Campbell-NWWA)

WELL AND WELL FIELDS IN TEXAS GULF COAST SEDIMENTS,
Guyton and Associates, Austin, Tex.
M. L. Klug, and W. F. Guyton.
Water Well Journal, Vol 14, No 1, p 14, p 27-30, Jan 1960.

Descriptors: *Water wells, *Well fields, Aquifer characteristics, Specific capacity, Observation wells, Drilling, Logging (Recording).
Identifiers: *Large capacity industrial wells, *Gulf coast, Pump tests, Well interference, Fresh water sands, Salt water sands.

Geologic and hydraulic characteristics of the aquifers in the vicinity where a groundwater supply is to be developed must be carefully evaluated to obtain the most economical and efficient wells and well field. Although this article deals primarily with wells in the Gulf Coast sediments, much of it is applicable to other parts of the United States. The Texas Gulf Coast sediments are comprised of alternating layers of sand and clay to a depth of several thousand feet. Thicknesses of individual layers range from a few feet to several hundred feet. In some areas there is considerable thickening and thinning of individual layers and many times a layer will pinch out completely in a short distance. Character and thickness of water-bearing sands vary both areally and with depth. The formations have a regional dip toward the coast. Dips may range from a few feet per mile in the outcrop areas to more than 100 feet per mile downdip. Local and sometimes widespread structures create variations from this regional pattern. The maximum depth at which fresh water occurs in the Gulf Coast sands varies from zero to more than 5,000 feet. In some areas brackish water may be encountered throughout all the sediments, while in other areas fresh water may be encountered in all sands to depths of more than 3,000 feet. In many places fresh water sands are encountered below sands which contain brackish water. Sands which contain fresh water in one area may contain brackish water only a short distance down-dip. (Campbell-NWWA)

JOHNSON SCREENS.
Universal Oil Products, St. Paul, Minn. John Div.

Catalog 169. St. Paul, Minnesota, UOP Johns 1969. 35 p.

Descriptors: *Well screens, *Equipment, *Wa wells, Well points, Groundwater, Wells, Dewa ing, Drilling fluid, Mud.
Identifiers: Self-jetting well points, Intake scre Slot openings, Gravel pack wells, Formation an sis, Grain-size classification, Filter elements, derdrains, Well screen installation, Gravel pack techniques, Water well development, Mechan surging, Surging with air, High-velocity jett Water well cleaning chemicals.

This catalog briefly summarizes the use of scre for water well installations. A well screen is on the most important parts of a water well becau serves as the water intake portion of the well. well screen must allow sand free water to flow the well in ample quantity and with minimum of head to supply the pump at full capacity. screen affects the following factors: (1) capa (2) drawdown and pumping lift, (3) productio sand-free water and (4) maintenance cost and of well. The catalog also discusses well screen cessories and application engineering approac (Campbell-NWWA)

OLYSIS GAS CHROMATOGRAPHIC TERMINATION OF ARYLSULFONIC ACIDS D SALTS,
sachusetts Univ., Amherst.
ey Siggia, and Lee R. Whitlock.
lytical Chemistry, Vol 42, No 14, p 1719-1724, 1970. 3 fig, 5 tab.

criptors: *Gas chromatography, *Water analy-Sulfonates, Salts, Analytical techniques.
tifiers: *Sulfonic acids, Chemical inter-nces.

quantitative determination of arylsulfonic s and their salts is described using pyrolysis gas matography to measure either sulfur dioxide the parent hydrocarbon. Sulfur dioxide is vered quantitatively; the parent hydrocarbon is vered at the 50 percent level or less. A linear onse for both is obtained for a range of sample hts from 0.2 to 1000 mg. Because of the sen-ity of gas chromatography, it is useful for direct ysis of aqueous solutions down to the parts-per-on concentration of sulfonate. The presence of um sulfonate does not interfere. By making ple solutions basic, the interference from sul- acid in sulfur dioxide measurement is inated. Addition of carbohydrozide to the lysis sample will significantly increase rocarbon recovery; for example, the recovery enzene from benzenesulfonic acid is increased 8 percent. Best results were obtained when the rozide was used alone without added diluent. rtland-Battelle)

DRILLER'S HANDBOOK NO. 1,
Petroleum Publishing Co., Tulsa, Okla.
J. O. Scott, and E. McGhee.
Oil and Gas Journal Technical Manual Reprint, Fifth Printing, 1964. 81 p.

Descriptors: *Drilling, *Drilling equipment, Oil industry, Oil wells, Rotary drilling, Casings, Pumps.
Identifiers: *Drilling line, *Drill string, *Mud pump, Drill collars, Tool joints, Drill pipe, Pump sizes, Pump maintenance, Pump operation, Pump installation.

Of interest to the novice experienced driller and drilling engineer, this handbook covers (1) design, handling and maintenance of drilling line, (2) design, handling, and maintenance of drill pipe, drill collars and tool joints, (3) installation, operation and maintenance of mud pumps, and (4) problems of high-pressure drilling. Written entirely in driller's language, the handbook is very useful for solving practical problems on the job with large oil rigs or smaller mineral-water well rigs. (Campbell-NWWA)
W71-07683

DRILLER'S HANDBOOK NO. 2,
Petroleum Publishing Co., Tulsa, Okla.
E. McGhee, P. L. Moore, G. R. Gray, J. W. Speer, and B. Q. Green.
Oil and Gas Journal Technical Manual Reprint, Fourth Printing, 1964. 70 p.

Descriptors: *Drilling, *Drilling equipment, Oil industry, Oil wells, Rotary drilling, Drilling fluids, Casings, Pumps.
Identifiers: Draw works, Compounding transmission, Chains, Drum brakes, Auxiliary brakes, Clutches, V-Belts, Drilling rate factors, Hydrostatic pressure, Bit weight, Rotary speed, Drilling-fluid properties, Hydraulic horsepower, Lost circulation materials, Economics of drilling, Contract bidding.

Of interest to the novice and experienced driller and the drilling engineer, Handbook No. 2 serves as an excellent companion to Handbook No. 1 and covers (1) the draw works and compounding transmission, (2) five factors that affect drilling rate, (3) chemical in drilling mud, (4) how to get the most hole for your money and (5) which lost-circulation materials to use and how to use them. There are three major steps which assure profit in contract drilling (1) intelligent bidding (2) drilling efficiency and (3) keeping costs low. Bidding and making hole depend on the geographical area, but keeping costs down carry through in every area. It starts with getting the proper equipment, continues and ends with maintaining that equipment properly. Written entirely in driller's language, the handbook is very useful for understanding the operation of many kinds of drilling equipment and for understanding the factors involved in more efficient drilling. The handbook is applicable to oil, water and mineral drilling operations. (Campbell-NWWA)

8B. Hydraulics

GATED SPILLWAY FOR RAYSTOWN RESERVOIR, JUNIATA RIVER, PENNSYLVANIA; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
N. R. Oswalt, and T. E. Murphy.
Sponsored by US Army Engineer District, Baltimore. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-15, Dec 1970. 9 p, 1 tab, 4 photo.

Descriptors: *Spillways, *Spillway gates, *Hydraulic models, Open channel flow.
Identifiers: *Raystown Reservoir, Juniata River, Flip buckets.

Model investigation of the two-bay spillway for Raystown Dam was concerned with flow conditions in the spillway approach, over the weir, and in the chute; performance of the flip bucket at the lower end of the chute; and the adequacy of riprap on the left bank across the Juniata River from the spillway discharge channel. Of primary concern were severe surges at the spillway gates that had been observed in models of other projects where operating conditions were similar to those at Raystown spillway. Tests were conducted in a 1:60-scale model that reproduced 1000 ft of upstream approach channel, the entire spillway including weir, chute, and flip bucket, and about 1000 ft of the downstream channel. Surges at the spillway gates did not occur under any anticipated operating conditions. Except for a minor deficiency in the height of a portion of the chute walls, all elements of the structure performed essentially as planned by the designers. (Oswalt-WES)

SPILLWAY FOR OAKLEY DAM, SANGAMON, ILLINOIS; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
E. S. Melsheimer.
Sponsored by US Army Engineer District, Chicago. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-13, Nov 1970. 10 p, 15 photo, 18 pl.

Descriptors: *Spillways, *Hydraulic models, *Stilling basins, Open channel flow, Riprap.
Identifiers: *Oakley Dam, Sangamon River.

Tests on spillway were conducted on a 1:60-scale model to determine flow conditions in approach and exit channels and the performance of various elements of the structure. Particular emphasis was placed on the selection of a stilling basin that would perform satisfactorily with a Froude number (3.0 plus or minus) of entering flow insufficient for ideal performance of a hydraulic-jump type basin. Approach flow conditions were generally satisfactory; no modifications to abutments were required. Tests also indicated that stone size selected for wave protection along the upstream embankment would be sufficiently large. The capacity of spillway was greater than computed; this is attributed to less than anticipated losses at the abutments and the absence of submergence effects of spillway flow. Basin selected for prototype construction was 70 ft shorter than the original design, utilized a 100-ft-long apron with 6-ft-high chute blocks, one row of 6-ft-high baffle piers, and 3.5-ft-high end sill. Observations also indicated that the roadway and bridge immediately downstream of the structure do not appear to be endangered at flows up to 25,000 cfs, nor do they impair stilling basin performance. Riprap protection is required on the embankments and in the exit below the structure. (Spivey-WES)
W71-07169

SPILLWAY FOR COPAN DAM, LITTLE CANEY RIVER, OKLAHOMA; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
B. P. Fletcher.
Sponsored by US Army Engineer District, Tulsa. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-9, July 1970. 13 p, 11 photo, 16 pl.

Descriptors: *Spillways, *Hydraulic models, *Stilling basins, Open channel flow.
Identifiers: *Copan Dam, Little Caney River.

Stilling basin for Copan Dam, which is expected to be subjected to unit discharges as large as 860 cfs, was studied on a 1:60-scale comprehensive model to confirm design and performance of proposed stilling basin and exit area. Flow conditions in approach area and over spillway were satisfactory. Original design stilling basin, which under design discharge conditions is subject to flow with a Froude number of 3, performed adequately. However, alternate designs were investigated and the model indicated that length of stilling basin could be reduced 20 ft without impairing hydraulic performance. Model tests were also conducted to investigate adequacy of proposed riprap for protection of exit area and feasibility of a retaining dike or levee which paralleled the center line of exit channel. Failure of both the exit channel protective stone and the levee occurred with design discharge conditions. However, the height of levee required to prevent overtopping and the magnitude and direction of currents along levee were determined in order that a stable levee could be provided, if desired. (Fletcher-WES)

SPILLWAY FOR KAW DAM, ARKANSAS RIVER, OKLAHOMA; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
B. P. Fletcher, and J. L. Grace, Jr.
Sponsored by US Army Engineer District, Tulsa. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-14, Dec 1970. 15 p, 11 photo, 25 pl.

Descriptors: *Spillways, *Hydraulic models, Open channel flow, Stilling basin.
Identifiers: *Kaw Dam, Arkansas River.

Spillway for Kaw Dam, which is expected to be subjected to discharges as large as 616,200 cfs, was studied on a 1:100-scale comprehensive model to determine flow conditions in the approach and exit channels and the performance of various elements of the structure. Modifications to left abutment were recommended to provide a more economical design without inducing excessive turbulence, surging, and/or drawdown in gate bays adjacent to left abutment. Capacity of spillway as determined with the model was slightly less than computed. Modification of left abutment did not alter the capacity. Tests indicated that original design stilling basin performed satisfactorily. Tests also indicated that use of a dike to prevent return flow from the large expanse left of the exit channel and stilling basin would permit reducing height and length of the left training wall and prevent excessive scour along left portion of exit channel. The designs of the right stilling basin training wall and the right tailrace training wall also were developed with the model. (Fletcher-WES)
W71-07176

SALAMONIE DAM FLIP BUCKET PROTOTYPE TESTS, SALAMONIE RIVER, INDIANA,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
D. F. Bastian.
Sponsored by US Army Engineer District, Louisville. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Miscellaneous Paper H-71-1, Jan 1971. 7 p, 5 pl.

Descriptors: *Prototype tests, *Jets, *Energy dissipation, Open channel flow.
Identifiers: *Flip buckets, *Salamonie Dam.

Prototype tests were conducted at Salamonie Dam in December 1969 to measure the jet throw distance from the flip bucket for three different discharges and the velocity distribution 1 ft upstream from the ramp crest for these same discharges. The actual throw distances agree reasonably well with computed design values. (Bastian-WES)
W71-07177

SPILLWAY AND OUTLET WORKS, TOCKS ISLAND DAM, DELAWARE RIVER, PENNSYLVANIA, NEW JERSEY, AND NEW YORK; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
E. S. Melsheimer.
Sponsored by US Army Engineer District, Philadelphia. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-10, July 1970. 15 p, 27 photo, 25 pl.

Descriptors: *Spillways, *Outlet works, *Delaware River, *Hydraulic models, Open channel flow, *Surges, Stilling basins.
Identifiers: *Tocks Island Dam, *Spillway chute.

The spillway for Tocks Island Dam was studied on a 1:60-scale comprehensive model and a 1:64-scale spillway model to determine flow conditions in the approach and exit channels and the performance of various elements of the structure. Modifications to both abutments were required to correct unequal distribution of flow that caused considerable turbulence and drawdown in the spillway bays adjacent to the abutments. Expected capacity of spillway was not adversely affected by the turbulence at the abutments. The surging phenomenon observed in gate bays at the larger gate openings was eliminated by maintaining a minimum bay width not less than 1.2 times the controlled head on the spillway, or about 53.5 ft in the six-bay spillway. The original spillway chute was modified to achieve reduction in cost without sacrificing hydraulic performance. To provide acceptable basin action the original basin had to be lowered 10 ft in elevation. Recommended stilling basin utilized a 204-ft-long apron at el 271.5 surmounted by two rows of 12-ft-high baffle piers and an 8.5-ft-high end sill. Riprap protection is required along the downstream toe of right embankment. (Melsheimer-WES)
W71-07179

DESIGN FOR FLOOD CONTROL AND WAVE PROTECTION, CHAGRIN RIVER, EASTLAKE, OHIO; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
C. E. Chatham, Jr.
Sponsored by US Army Engineer District, Buffalo. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-11, Sept 1970. 18 p, 11 tab, 33 photo, 26 pl.

Descriptors: *Flood control, *Waves (Water), *Hydraulic models, Breakwaters, Lake Erie, *Shore protection.
Identifiers: *Chagrin River, *Eastlake (Ohio).

A 1:75-scale model of the lower 2000 ft of the Chagrin River and sufficient offshore area in Lake Erie to permit generation of the required test waves was used to investigate the arrangement and design of certain proposed improvements with respect to wave action and flood control. Proposed improvement plans consisted of (1) arrowhead breakwaters in Lake Erie at the mouth of the river, aggregating about 2360 ft in length; (2) realignment and enlargement of the river channel from Lake Erie through the city of Eastlake, with levees where required to supplement channel enlargement; (3) a spur channel and an access channel for navigation; (4) recreational facilities at the river mouth; and (5) the addition of beach fill and protective groins along the shoreline east of the east breakwater. A 60-ft-long wave machine and electrical wave height measuring and recording apparatus were utilized in model operation. Conclusions from tes results are given. (Chatham-WES)
W71-07180

SPILLWAY FOR ALUM CREEK DAM, ALUM CREEK, OHIO; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
G. A. Pickering.
Sponsored by US Army Engineer District, Huntington. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-4, Apr 1970. 11 p, 3 photo, 13 pl.

Descriptors: *Spillways, *Hydraulic models, Open channel flow, Stilling basins, Gates, Discharge coefficients.
Identifiers: *Alum Creek Dam, Tainter gates.

Tests were conducted on a 1:60-scale model of the Alum Creek Dam spillway to determine flow conditions in the spillway approach channel, discharge characteristics of the spillway, stilling basin performance, and flow conditions in the outlet channel. The spillway consisted of an ogee crest with three 34-ft-wide by 25-ft-high tainter gates, a spillway chute, and a hydraulic-jump type stilling basin. Flow conditions in the cured approach channel to the spillway were satisfactory for the expected discharges. The discharge capacity of the original design was slightly greater than expected. Discharge coefficients and pier and abutment contraction coefficients were determined from model data. The original design stilling basin did not perform satisfactorily. However, a satisfactory and more economical design was developed. Velocities of flow were measured in critical areas of the approach and outlet channels for use in design of riprap protection. (Pickering-WES)

A STUDY OF STORM-WATER INLET CAPACITIES,
Louisiana State Univ., Baton Rouge. Div. of Engineering Research.
William A. Wintz, and Yung H. Kuo.
Available from the National Technical Information Service as PB-196 129, $3.00 in paper copy, $0.95 in microfiche. Louisiana Department of Highways, 1970. 96 p, 61 fig, 19 tab, 7 ref. DOT BPR 466-042.

Descriptors: *Intakes, *Drainage systems, *Drainage engineering, *Surface runoff, *Hydraulic models, *Road design, Model studies, Hydraulics, Hydraulic similitude, Hydraulic engineering, Drains, Highways, Runoff, Storm runoff, Louisiana.
Identifiers: *Storm water inlets, *Highway drainage, Inlet capacities.

Graphs and equations are presented for use by engineers in computing the capacities of four standard types of storm water inlets used by the Louisiana Department of Highways. Full-size model studies were made of the hydraulic characteristics of these inlets at Louisiana State University. The model, representing one lane of a highway with curb and inlet, was 12 feet wide and 72 feet long. It was completely adjustable to permit varying the longitudinal and cross slopes, for changing inlets and curbs, and for supplying either one-way or two-way flow. The water flow was controlled to produce uniform and steady flow conditions over a surface having a roughness coefficient (Manning 'n') of 0.01, approximating that of a concrete road-way. Experiments were conducted to determine the ratio of the total flow intercepted by each of the four standard inlets when used under different conditions simulating actual field installations. Two different curb types were used -- a roll-over curb and a barrier curb. The inlets were combination types consisting of a surface grate and a curb op-

Two graphs were developed for each set of
able parameters. By entering the graphs with
med values of flow and cross-slope, the ratio of
rcepted flow to total flow and the linear spread
water over the road width can be predicted.
ommendations are made on curb selection,
ss slope, and inlet types. Empirical flow formu-
re also presented. (Poertner)

tions are obtained for flux distribution close to
nerged turbulent jet outlets. All solutions use
lated probability functions or exponential
tions. A comparison is made with momentum
data for axisymmetric jets and a plane-symmet-
et in a coplanar flow, and agreement is shown
e good. A generalized Reichardt hypothesis is
loyed to obtain Gaussian distributions for the
of mass, heat and momentum and permits su-
osition of elementary solutions. The analysis is
ented for plane and axisymmetric flows. An ad-
nent to the origin of the data matches axial flux
with the mathematical model and defines a
ading coefficient, leading to a complete defini-
of the flux distribution. The solutions are in the
of a distorted chisquare distribution, and two
rted normal distributions. A simple solution
nd the potential core uses the axial distribu-
of flux to obtain the radial distribution directly.
analysis shows promise of providing
ghtforward solutions for free turbulent flows involving complex boundary conditions. (Upadhyaya-Vanderbilt)

DETERMINING SEEPAGE CHARACTERISTICS OF MILL-TAILINGS DAM BY THE FINITE-ELEMENT METHOD,
Bureau of Mines, Washington, D.C.
Charles Daniel Kealy, and Richard A. Busch.
Available from the National Technical Information Service as PB-197 027, $3.00 in paper copy, $0.95 in microfiche. Report of Investigations RI-7477, Jan 1970. 113 p, 34 fig, 2 tab, 52 ref.
Identifiers: *Seepage, Mathematical models, *Water pollution, Control, *Tailings, Earth dams, Computer programs, Embankments, Stress, Two dimensional flow, Soil mechanics, Finite element analysis, *Mill tailings disposal.

Finite-element, mathematical models that solve LaPlace's and Richard's equations numerically were used to locate the phreatic surface within tailings pond embankments and to define the subsurface flow of water from the pond. Both must be known to design structurally and environmentally safe tailings dams. The permeability distribution within and beneath the embankment, the fluid potential values upgradient and downgradient from the embankment, and the geometry and elevation of an approximately impermeable layer at some depth beneath the embankment were used as computer inputs in analyzing over a dozen finite-element models of tailings dams varying structurally from simple to complex. Results predicted with the finite-element model were confirmed with measurements in a laboratory model of a tailings pond and in the field. Of particular importance to the design of safe slopes, all data indicated that the phreatic surface within a tailings dam is concave upward, a configuration opposite that in most earth dams. The close correlation between predicted and experimental values confirmed the practicability of using the finite-element technique to design safe tailings dams.

Identifiers: *Canal cleaning, *Conduit cleaning.

By following a systematic cleaning and maintenance program in recent years, the Colorado River Aqueduct has been kept in condition to deliver substantially greater flows of water to the coastal plain of Southern California than it was originally designed to carry. The condition of the conduit surfaces is briefly described, as well as the annual cleaning operations designed to remove flow-impeding aquatic deposits from the walls of the conveyance system. An analysis of the variations in Manning's roughness coefficient n is presented for various components of the system. A comparison of such n values before and after mechanical cleaning of the aqueduct is given in summary form. (Knapp-USGS)

8C. Hydraulic Machinery

FLOW INVESTIGATION IN A FRANCIS TURBINE,
Institute of Turbomachinery, Graz (Austria).
H. Fachbach.
Paper 70-WA/FE-16, Transactions American Society of Mechanical Engineering Series D -- Journal of Basic Engineering, 1970. 9 p, 16 fig, 9 ref.

Descriptors: Hydraulic machinery, *Francis turbines, Turbine parts, Turbine runners, Turbine efficiency, Turbine blades, *Experimental data, Theoretical analysis, Fluid flow, Instrumentation, Boundary layer, Coriolis force, Circulation, Velocity, Losses, Impellers, *Turbines, Specific speed, Foreign research, Hydraulic design, *Hydraulic turbines.
Identifiers: Austria, Mechanical models, Analytical method.

Development of hydraulic machines during the past decades was characterized by empiric methods leading to high efficiencies but contributing little to knowledge of the flow field in the machinery. For computation and design, 1- or 2-dimensional methods combined with experimental results were often used. Recently, 3-dimensional analytical methods developed in the fields of compressors or gas turbines were used in designing hydraulic parts and computing flow data. All methods of analysis are based on assumptions; the usefulness to be tested by experimental investigations. Results of theoretical and experimental investigations of the flow in a Francis water turbine are presented. The flow visualization with the aid of rotating 5-borehole probes provides the relative velocities, the pressure and energy distribution, the slip factor, the boundary layers, and the secondary flow. Theoretical and experimental results are compared, and the usefulness of assumptions based upon computations is discussed. (USBR)

ON THE INFLUENCE OF WATER TURBINE CHARACTERISTIC ON STABILITY AND RESPONSE,
English Electric Co, Ltd., Netherton (England).
E. Goldwag.
Paper 70-WA/FE-15, Transactions American Society of Mechanical Engineers, Series D--Journal of Basic Engineering, 1970. 13 p, 15 fig, 14 ref.

Descriptors: Hydraulic machinery, *Hydraulic turbines, *Stability, Characteristics, *Machine design, Hydraulic engineering, Velocity, Head (Fluid mechanics), Accuracy, Fluid flow, Foreign research, High head, Low head, Mathematical analysis, Performance, Torque.
Identifiers: *Response time, Great Britain.

Given a real turbine characteristic, equations giving discharge and torque can be derived in terms of certain characteristic slopes, speed changes, and pressure deviations. For reaction turbines, the flow through the machines is speed-dependent and the effect of this phenomenon on the pressure dependence of flow is significant. Conventional representation of the pressure dependence of torque is cor-

rect only in the case of one particular type of turbine. A formula allowing establishment of the correct relationship for any characteristic is given. Nonlinearities of the quantity-gate and torque-gate relationships are examined, and the concept of the effective gate is introduced to improve accuracy of any predictions. Modified relationships are used in establishing the bounds of the region in which stable operation of a unit can be achieved, depending on the slope of the appropriate unit quantity-unit speed curve. Governor parameters leading to critical damping are a function of this characteristic slope. Neglecting the speed dependence of the turbine discharge can result in significant errors, especially when dealing with low head and high head machines. (USBR)

HYSTERESIS CHARACTERISTICS OF FRANCIS PUMP-TURBINES WHEN OPERATED AS TURBINE,
Hatachi Ltd., (Japan)
M. Yamabe.
Paper 70-FE-D, Transactions American Society of Mechanical Engineers, Series D -- Journal of Basic Engineering, 1970. 5 p, 8 fig, 1 tab, 2 ref.

Descriptors: *Francis turbines, *Pump turbines, *Hysteresis, Design, *Characteristics, Experimental data, Pumped storage, Specific speed, Turbine parts, Foreign research, Turbine runners, Guide vanes, Fluid flow, Cavitation, Hydraulic machinery, Turbine efficiency, Torque, Prototypes, Model studies, *Hydraulic turbines, Pumps.
Identifiers: Japan, Mechanical models.

Pump turbines for pumped storage projects have a broad range of operating head when compared with turbines for conventional generating plants. Proper adjustment must be given to guide vane and runner vane openings to maintain a good operating condition at all times. Accordingly, when a Francis pump turbine of fixed-vane type is used on pumped storage projects, a poor flow condition is unavoidable under certain condition of operation. Results obtained through experiments on models to determine the phenomena of the hysteresis characteristics of Francis pump turbines generated when operated as a turbine are described. The condition for generating the phenomena is regulated by the cavitation factor and guide vane openings and is affected by the specific speed of a pump turbine. Some additional characteristics of the flow state within a runner are discussed. (USBR)

NEW CONCEPTS IN ROTARY DRILLING BITS,
Smith Tool Co., Houston, Tex.
L. L. Garner.
Paper, Spring Meeting, Pacific Coast District, Division of Production, American Petroleum Institute, May 13-15, 1969, Los Angeles, California. Drilling-DCW, Nov 1969. 6 p.

Descriptors: *Drilling, *Oil industry, *Drilling equipment, Rotary drilling.
Identifiers: *Drill bits, Sealed bearing bits, Carbide bits, Bottom hole jet bits, Mud motor bits.

When drilling specific rock types, the basic design concept principles of 3-cone rotary drill bits in recent years has remained relatively constant with no significant changes. New applications, developments and improvements utilizing the same design principles are changing some of the oil concepts, creating many new and interesting trends. These new design areas, including applications, developments and improvements did not in all cases necessarily improve due to bit development. For example, most design developments improved in steps. Sometimes the breakthrough or advance was due to other related support equipment such as drill pipe, new mud pumps, circulation material etc. There are drilling tools which in the past have seen limited use due to the fact the right idea or application took time in developing. Replacement of roller bearings with friction bearings in rotary rock bits has seen limited success until recently, due to improved seals. Tungsten carbide bits in the past have been used, generally to drill only hard formations. Design changes following the same general concept of milled tooth designs are now using tungsten carbide bits to drill even softer rock. Bottom hole jets will be utilized more, as recent tests indicate their usefulness in conjunction with downhole mud motors. Mud motor bits or rotary bits, modified in recent years to resist the skidding and abrasion wear created when used with high speed down hole motors, are being improved and will be more widely used. (Campbell-NWWA)

8D. Soil Mechanics

A REVIEW OF APPLICATIONS OF THE FINITE ELEMENT METHOD OF ANALYSIS TO PROBLEMS IN SOIL AND ROCK MECHANICS,
Corps of Engineers, Vicksburg, Mass.; and Texas Univ., Austin.
N. Radhakrishnan, and L. C. Reese.
Soils and Foundation, Vol 10, No 3, p 95-112, Sept 1970. 18 p, 85 ref, append.

Descriptors: *Finite element method, *Soil mechanics, *Rock mechanics, Bearing capacity, Culverts, Embankments, Piles (Foundations), Analytical techniques, Seepage, Slope stability, Soil dynamics, Displacements, Soil engineering, *Reviews, *Bibliographies, Computer applications, Stress, Earth pressure, Settlement (Structural), Deformation, Numerical analysis.
Identifiers: Soil modulus.

The finite element method of analysis has been applied to a wide variety of problems in soil and rock mechanics. Developments and applications of the method to problems in slope stability, embankments, culverts, pavements, bearing capacity, piles, soil dynamics, seepage, and rock mechanics are reviewed. The finite element method is essentially a systematic numerical procedure for solving boundary values and some initial problems in continuum mechanics. High-speed digital computers have accelerated the development and use of this technique in several fields of civil engineering. Advantages of the finite element method compared to other numerical approaches are numerous. The method can handle: complicated, realistic geometries; layered isotropic or anisotropic materials with linear, nonlinear, or viscous properties; mixed boundary conditions; and constructional sequences in earth building operations. These features are particularly useful for solving problems in soil and rock mechanics. Good comparisons between results of the finite element solution and field and laboratory observations are reported. (USBR)

THE SAN FERNANDO, CALIFORNIA, EARTHQUAKE OF FEBRUARY 9, 1971.
Geological Survey, Washington, D.C.

For sale by Superintendent of Documents, US Government Printing Office, Washington, DC, 20402, Price $2.25. Joint publication of US Geological Survey and National Oceanic and Atmospheric Administration: Geological Survey Professional Paper 733, 1971. 254 p.

Descriptors: *Earthquakes, *California, Reviews, Surveys, Earthquake engineering, Faults (Geology), Seismic studies, Disasters, Landslides, Land subsidence, Movement, Reservoirs, Reservoir design, Dam failure.
Identifiers: *San Fernando (Calif), *San Fernando Earthquake (1971).

The violent tremors that shook the San Fernando area of California on the morning of February 9, 1971, are a reminder that earthquakes are a natural and permanent part of the environment in sizeable areas of the United States. Had the Lower Van Norman Lake Dam, which was close to collapse when the earthquake ended, actually failed, the San Fernando earthquake might have become in famous as the deadliest in United States history. The ground accelerations produced by this moderate magnitude (6.6) earthquake were the highest ever recorded, that is, in the 0.5- to 0.75-g range with several high-frequency peaks to 1 g. This report is a preliminary evaluation of data gathered by many groups of investigators during the first 3 weeks after the earthquake. A list of cooperating organizations is given. (See also W71-07660 thru W71-07663) (Knapp-USGS)

LANDSLIDING IN THE VICINITY OF THE VAN NORMAN LAKES,
Geological Survey, Washington, D.C.
T. L. Youd.
In: The San Fernando, California, Earthquake of February 9, 1971, Geological Survey Professional Paper 733, p 105-109, 1971. 5 p, 3 fig, 3 ref.

Descriptors: *Landslides, *Earthquakes, *California, *Hydrogeology, *Pore pressure, Soil mechanics, Groundwater, Soil strength, Faults (Geology), Disasters, Land subsidence, Dam failure, Movement, Reservoirs.
Identifiers: *San Fernando (Calif), *San Fernando Earthquake (1971), *Van Norman Lakes (Calif).

In the Van Norman Lakes area of Los Angeles, California, the 1971 earthquake triggered a large number of landslides, some of them down very gentle slopes. The Van Norman Lakes lie in a valley eroded in north-dipping strata of the Saugus and Modelo Formations. The lakes are impounded at their south ends by dams constructed across the valley. Because of the reservoirs and a confined aquifer in the Little Tujunga syncline, the water table in the general area is at a relatively high level and intersects the surface at several locations. The most reasonable explanation for slippage on slopes of such low gradient is that the underlying soil were partially or completely liquefied during the earthquake. The many sand boils observed on or near the slide are evidence that this occurred. It is probable that movements on many, if not all, of the slides in the alluvium surrounding the Van Norman Lakes were directly attributable to increased pore water pressures generated by the earthquake. W71-07660

WATER RESOURCES ASPECTS,
Geological Survey, Washington, D.C.
A. O. Waananen, and W. R. Moyle, Jr.
In: The San Fernando, California, Earthquake of February 9, 1971, Geological Survey Professional Paper 733, p 119-125, 1971. 7 p, 3 fig, 2 tab, 2 ref.

Descriptors: *Landslides, *Earthquakes, *California, *Hydrogeology, *Pore pressure, Soil mechanics, Groundwater, Soil strength, Faults (Geology), Disasters, Land subsidence, Dam failure, Movement, Rservoirs.
Identifiers: *San Fernando (Calif), *San Fernando Earthquake (1971), *Van Norman Lakes (Calif).

Damage to hydraulic structures constituted a major impact on water resources of the San Fernando earthquake of February 9, 1971. The effects on the water resources of the region included noticeable fluctuations in the stages of streams and reservoirs and water levels in wells, the roiling of water in water-supply systems, short-term changes in groundwater levels. The major damage was caused by the principal M6.6 shock that occurred at 0601 hours February 9. The Van Norman Lakes, a series of reservoirs at the head of the San Fernando Valley, suffered severe damage. The earth dams on both the Upper and the Lower Van Norman Lake were severely damaged by the earthquake. The dam at the upper lake moved about 2 m downstream and the crest slumped substantially. The dam on Lower Van Norman Lake, initially completed in 1918, was fractured, the c

mped, and a large part of the upstream concrete ing of the dam slid into the reservoir. Fortunate- the dam was not breached. (See also W71-659) (Knapp-USGS)

MAGE TO CONSTRUCTED WORKS, AS-CIATED WITH SOIL MOVEMENTS AND UNDATION FAILURES,
ological Survey, Washington, D.C.
L. Youd, and H. W. Olsen.
The San Fernando, California, Earthquake of 9, 1971, Geological Survey Professional Paper 3, p 126-132, 1971. 7 p, 8 fig.

scriptors: *Earthquakes, *California, *Reviews, rveys, Earthquake engineering, Faults (Geolo-, Seismic studies, Disasters, Landslides, Land sidence, Movement, Reservoirs, Reservoir ign, Dam failure.
ntifiers: *San Fernando (Calif), *San Fernando thquake (1971).

s report describes earthquake damage to dams canals, transportation routes, utilities, and ldings in the northern San Fernando Valley that caused by, or associated with, various types of movements and foundation failures. Because reconnaissance was relatively brief and limited cope, the information presented is a preliminary partial account of these types of damage. The ruary 9 earthquake severely damaged the per and Lower Van Norman Dams. The latter eared to have been on the brink of failure, ch would have created catastrophic inundation the heavily populated area below. Eighty usand people were forced to abandon their nes for 4 days while the water level in the reser- was lowered to a level which would preclude ding in case of further damage to the dam dur- strong after-shocks. In the vicinity of the Van rman Lakes, sections of several canals were ly damaged and rendered unusable until major airs could be made. Several flood-control dikes suffered slumping, but because they were not ounding water at the time of the shock, their ure presented no immediate hazard. The prin- al damage to the Lower Van Norman Dam was a sive upstream slope failure which dislodged a or segment of the earthfill embankment and osited it on the reservoir floor. 8E. Rock Mechanics and Geology

A NEW METHOD FOR THE DETERMINATION OF DEFORMABILITY IN ROCK MASSES,
Laboratorio Nacional de Engenharia Civil, Lisbon (Portugal).
M. Rocha, and J. N. da Silva.
Proceedings 2nd Congress International Society of Rock Mechanics, Theme 2, No 21, Belgrade, Yugoslavia, Sept 1970. 15 p, 26 fig, 3 tab, 8 ref.

Descriptors: Rocks, *Deformation, Deformation modulus, Measurement, Field tests, Equipment, *Rock mechanics, *Rock properties, *Flat jack method.
Identifiers: Dilatometers.

A new method for determining deformability in rock masses is presented to show how large undisturbed volumes can be tested quickly and economically. The method essentially consists of applying pressures using thin flat jacks in slots cut with a diamond disk at the surface of the rock mass. The authors describe the machines developed, indicate the procedure for calculating the modulus of deformability of the rock mass from the openings measured in the slots, discuss the problem of the characterization of deformability in rock masses by resorting to correlations between results of the new method and results of dilatometer tests, and present instances of application of the new method. (USBR)

STUDIES OF PROPERTIES AND CONDITIONS OF ROCK MASSIFS BY SEISMIC ACOUSTICS METHODS,
Vsesoyuznyi Nauchno-Issledovatelskii Institut Gidrotekhniki i Meloratsii, Moscow (USSR).
A. G. Sykoshin.
Proceedings 2nd Congress International Society of Rick Mechanics, Theme 1, No 14, Belgrade, Yugoslavia, Sept 1970. 7 p, 4 fig, 8 ref.

Descriptors: Rocks, *Fissures, *Joints (Geology), Site selection, Test procedures, *Seismic investigations, Anisotropy, *Rock mechanics, *Rock properties, *Seismic tests, Heterogeneity, Deformation, Ultrasonics, *Rock tests, Ultrasonic tests.
Identifiers: *Acoustic method.

The report deals with the procedures used and results obtained after the application of seismic-acoustic methods to study jointing, anisotropy, and heterogeneity of rock masses, as well as the influence of these factors on deformation properties of rocks. A special feature of the procedure is the application on a large scale of the multifrequency modifications of seismic acoustics (seismic, acoustic, and ultrasound methods). The studies determine: (1) the qualitative properties of jointing (volume of joints, prevailing directions of joint systems, and properties of joint filling); (2) the grade, character, and nature of anisotropy; and (3) the heterogeneity and dimensions of the heterogeneity elements (blocks). W71-07074

DETERMINATION OF ELASTIC PROPERTIES OF ROCKS USING VARIOUS ON-SITE AND LABORATORY METHODS,
Dames and Moore, Seattle, Wash.
M. Bukovansky.
Proceedings 2nd Congress International Society of Rock Mechanics, Theme 2, No 9, Belgrade, Yugoslavia, Sept 1970. 4 p, 1 tab, 8 ref.

Descriptors: Rocks, Elasticity (Mechanical), Field tests, Loading tests, Laboratory tests, Boreholes, Sandstone, Schist, Modulus of elasticity, Dolomite, *Rock properties, *Rock mechanics, *Plate load tests, Flat jack method.
Identifiers: Plate bearing tests, Czechoslovakia, Dilatometers, Radial jacking tests, Bedding.

Elastic properties of the rock mass comprise important input data for all engineering analyses; numerous laboratory and on-site methods have been developed for determining the elastic properties. A research program was conducted for high-pressure water tunnels on various sites in Czechoslovakia. Several static methods have been used for elastic properties determination, such as laboratory tests, borehole dilatometer tests, plate-load tests, flatjack tests, and radial jacking tests. Three different rock types have been tested: thick-bedded sandstones, highly fractured dolomites, and jointed crystalline schists. The plateload test is one of the simplest and most reliable methods for modulus estimation. Only when wide-spaced jointing or bedding occurs do radial jacking tests or calculation of the rock mass modulus using, separately, rock substance and joint properties, provide reliable data. (USBR)

STRETCHING OF VISCOELASTIC LIQUIDS,
Delaware Univ., Newark.
M. M. Denn, and G. Marrucci.
American Institute of Chemical Engineers Journal, Vol 17, No 1, p 101-103, Jan 1971. 3 p, 3 fig, 11 ref. OWRR Project A-009-DEL (1).

Descriptors: *Viscous flow, *Liquids, *Viscosity, *Shear, *Viscometers, Tensile stress, Analytical techniques, Heat transfer, Velocity, Time, Tensile strength.
Identifiers: *Viscoelastic liquids, Liquid stretch rate.

Analyses of stretching of a viscoelastic liquid have been interpreted as showing that there is a maximum stretch rate to which the material can be subjected, and several physical phenomena have been explained on this basis. This report shows theoretically and experimentally that the concept of a limiting stretch rate does not have general validity. (Woodard-USGS)

8H. Rapid Excavation

PERFORMANCE OF TUNNEL BORING MACHINES,
Southern California Metropolitan Water District, Los Angeles.
R. J. Proctor.
Engineering Geology Bull AEG, Vol 6, No 2, p 105-117, Fall 1969. 13 p, 9 fig, 1 tab, 39 ref.

Descriptors: *Tunneling, *Tunneling machines, Tunnel construction, *Rapid excavation, Earth

handling equipment, Rock excavation, Rocks, Diversion tunnels, Earth movements, Hardness, Compressive strength, Mining, Geology, Faults (Geology), Performance, Statistics, *Boring machines, Construction equipment, Bibliographies. Identifiers: Greenside-McAlpine Tunneling Machine, Oso Tunnel, Colo.

Technological advances in tunnel boring machines are being made so rapidly that many present limitations soon will be overcome. Some information on the current performance of these machines and on tunneling events is desirable. More than 100 mole tunnels have been excavated in the world, the first being in Massachusetts in 1856. Some problems with moles, unconfined compressive strength related to moles, and specific references are discussed. Statistics cited are: (1) the largest mole cut a 36-ft 8-in.-dia tunnel for the Mangla Dam Diversion Tunnels system in West Pakistan; (2) the heaviest mole - 500 tons, excavated part of the Paris Subway; (3) the fastest mole excavation - cut 419 ft/day in the Oso Tunnel, Colorado; and (4) the hardest rock excavated by mole - 57,000 psi granite in Austria, 51,000 psi quartzite in Idaho, and rhyodacite in Nevada with a Mohs' hardness slightly greater than 7. (USBR)

IMMERSED TUNNEL CONSTRUCTION,
H. C. Wentink.
In: Advisory Conference on Tunneling of the Organization for Economic Co-Operation and Development, Aug 1970. 42 p.

Descriptors: *Tunneling, *Construction, *Underground structures.
Identifiers: *Immersed tunnels, Technological improvement, Questionnaire.

The document is concerned with tunnels composed of elements constructed in a dry-dock or on a slipway and subsequently transported to the construction site, where they are sunk, placed on a foundation, and connected together under water. The questionnaire dealing with immersed tunnels brought in replies from twelve countries, many of which were based only on a theoretical knowledge of the subject or on experience with tunnels of very small cross-section.

BOSTON STILL FACES A POLLUTION CONTROL PROBLEM: DEEP TUNNEL PLAN PROPOSED AS SOLUTION,
Joseph Cazzaza.
Water Wastes Eng, Vol 7, No 9, p 44-47, Sep 1970.

Descriptors: *Water pollution control, *Pollution abatement, Sewers, Sewerage, Treatment facilities, Massachusetts.
Identifiers: *Deep tunnel plan, *Boston (Mass).

In this article the related development of combined sewerage systems in the Boston metropolitan area is traced and some of the major attempts to abate pollution in the harbor and its estuaries are discussed. Presently, the sewage from the area south of the old Boston Main Drainage District is treated at the Nut Island plant, while most of the sewage from the remaining Metropolitan Sewerage District is treated at the Deer Island plant. The two plants provide primary treatment and chlorination for all dry-weather flows from the metropolitan area, yet they cannot handle the enormous quantities of mixed flows during storm conditions. A description of the deep tunnel plan, with an estimated construction cost of $430 million, is included.
W71-07509

RESEARCH AND DEVELOPMENT RELATED TO TUNNELING.
Organization for Economic Co-Operation and Development, Paris (France).

In: Advisory Conference on Tunneling of the Organization for Economic Co-Operation and Development, Aug 1970. 108 p.

Descriptors: *Tunneling, *Research and development, Construction, Underground structures.
Identifiers: Questionnaire.

The document is concerned with the status of applied research and development relating to tunneling technology. Applied research and development means theoretical and experimental studies of new design methods and construction techniques, including studies of the properties, character and behavior of tunnel structures, and of the ground mass in which they are constructed.
W71-07510

CUSTOM DESIGNED SHIELD LEAVES NO SPACE BEHIND AS IT SETS TUNNEL RINGS.

Construct Methods Equip, Vol 52, No 8, p 64-67, 70, 72, Aug 1970.

Descriptors: *Drilling, *Tunnel construction, *Tunneling machines, Tunnel design.
Identifiers: *Tunneling shield, *Mexico.

A tunneling shield used to drive a 30-ft diameter bore at shallow depths in soft, unstable ground, was designed to progress through drive cycles without leaving an annular space behind the shield after the shove had been made. The tunnel was driven up a constant incline having profile variations of from 0.8 to 7% at depths ranging from 52 1/2 feet to 16 feet below street level. Guidance made use of a laser and target system; excavation was performed by a dozen miners working from the shield's six breasting tables with pneumatic spades and rock breakers. A description of the tunneling cycle is given.

W71-07560 06A

INSECT CONTROL
ON THE USE OF PHOSPHAMIDON FOR ERADICATION OF FRESH WATER FISH PREDATORS,
W71-07138 05C

INSECTICIDES
EFFECTS OF ROTENONE ON ZOOPLANKTON COMMUNITIES AND A STUDY OF THEIR RECOVERY PATTERNS IN TWO MOUNTAIN LAKES IN ALBERTA,
W71-07353 05C

SOURCES OF COMPOUNDS INTERFERING WITH THE ANALYSIS OF EXTRACTS FOR DIELDRIN AND DDT BY GLC,
W71-07397 05A

NOTE ON REMOVAL OF SULFUR INTERFERENCES FROM SEDIMENT EXTRACTS FOR PESTICIDE ANALYSIS,
W71-07621 05A

SUMMARY OF INTERIM GUIDELINES FOR DISPOSAL OF SURPLUS OR WASTE PESTICIDES AND PESTICIDIE CONTAINERS.
W71-07699 05B

PROCEEDINGS OF THE NATIONAL WORKING CONFERENCE ON PESTICIDE DISPOSAL, AT NATIONAL AGRICULTURAL LIBRARY, BELSVILLE, MARYLAND, JUNE 30 AND JULY 1, 1970.
W71-07700 05B

GROUND DISPOSAL OF PESTICIDES THE PROBLEM AND CRITERIA FOR GUIDELINES.
W71-07701 05B

INSECTICIDE-RESISTANT FISH
POSSIBLE SELECTIVE MECHANISMS IN THE DEVELOPMENT OF INSECTICIDE-RESISTANT FISH,
W71-07143 05C

INSPECTION
THE SANITARY HISTORY OF CHICAGO,
W71-07696 05G

INSTITUTION
ECONOMIC AND INSTITUTIONAL ASPECTS OF WATER TRANSFERS IN NORTHWEST NEVADA,
W71-07504 06E

INSTITUTIONS
PROMISING AREAS FOR RESEARCH ON INSTITUTIONAL DESIGN FOR WATER RESOURCES MANAGEMENT,
W71-07498 06B

PRIORITIES FOR DEVELOPING LEGAL AND ECONOMIC RESEARCH ON WATER PROBLEMS,
W71-07499 06B

INSTRUMENTATION
DEVELOPMENT AND PERFORMANCE OF A MOBILE WATER QUALITY MONITOR,
W71-07536 05A

PRIME NEED INSTRUMENTS FOR USE IN FIELD,
W71-07540 05A

INTAKES
A STUDY OF STORM-WATER INLET CAPACITIES,
W71-07199 08B

INTERDISCIPLINARY APPROACH
HISTORY OF THE DEVELOPMENT OF USE OF THE GREAT LAKES AND PRESENT PROBLEMS,
W71-07567 06B

INTERNATIONAL JOINT COMMISSION
NEW REQUIREMENTS IN WATER RESOURCES PLANNING ON THE GREAT LAKES,
W71-07574 06B

INTERNATIONAL TREATY
HYDRO-ELECTRIC POWER DEVELOPMENT ON THE GREAT LAKES SYSTEM,
W71-07566 06B

INTERSTATE
IMPLEMENTATION OF REGIONAL RESEARCH IN WATER-RELATED PROBLEMS.
W71-07497 06B

PROMISING AREAS FOR RESEARCH ON INSTITUTIONAL DESIGN FOR WATER RESOURCES MANAGEMENT,
W71-07498 06B

INTERSTATE COMMISSIONS
INTERSTATE COMMISSION ON THE POTOMAC RIVER BASIN--COMPACT.
W71-07440 06E

INTERSTATE COMPACTS
WATER RESOURCES PLANNING STUDY FOR ARKANSAS AND OKLAHOMA,
W71-07135 04A

LEGISLATION FACILITATING NEGOTIATION OF AN INTERSTATE COMPACT RESPECTING THE HUDSON RIVER.
W71-07220 06E

INTERSTATE COMMISSION ON THE POTOMAC RIVER BASIN--COMPACT.
W71-07440 06E

SUSQUEHANNA RIVER BASIN COMPACT.
W71-07453 06E

INTERSTATE RIVERS
INTERSTATE COMMISSION ON THE POTOMAC RIVER BASIN--COMPACT.
W71-07440 06E

INTERSTITIAL WATER
INTERSTITIAL WATER STUDIES ON SMALL CORE SAMPLES, DEEP SEA DRILLING PROJECT, LEG 6,
W71-07288 02J

INTERSTITIAL WATER CHEMISTRY DEEP SEA DRILLING PROJECT, LEG 6,
W71-07289 02J

INTERTEMPORAL CRITERIA
PUBLIC INVESTMENT, THE RATE OF RETURN, AND OPTIMAL FISCAL POLICY,
W71-07596 06B

INTER-BASIN TRANSFERS
THE AREA OF ORIGIN AND A COLUMBIA RIVER DIVERSION,
W71-07487 06E

INVERTEBRATES
THE INFLUENCE OF OXYGEN TENSION ON THE PRESSURE RESISTANCE OF SOME MARINE INVERTEBRATES (IN GERMAN),
W71-07149 05C

INVESTIGATIONS
INVESTIGATION OF PHOTOSYNTHETIC TRANSIENTS IN CHLORELLA USING RADIOACTIVE CARBON DIOXIDE (IN GERMAN),
W71-07350 07B

INVESTMENT
A STUDY OF LOCAL NEEDS FOR WATER POLLUTION CONTROL FACILITIES IN FISCAL YEARS 1971-76.
W71-07192 05D

REGIONAL ALLOCATION OF PUBLIC INVESTMENT,
W71-07595 06B

INVESTMENT PRIORITIES
PRIORITY AND PLANNING ELEMENTS FOR DEVELOPING ILLINOIS WAT RESOURCES.
W71-07197 06A

ION EXCHANGE
APPLICATIONS OF ION-EXCHANGE RESINS IN NON-AQUEOUS MEDIA THE SEPARATION AND ANALYSIS OF PETROLEUM ADDITIVES,
W71-07403 05A

ION PAIRING
ION PAIRING IN 2 2 COMPLEX ION ELECTROLYTES (CO(NH3)5NO2)SO4,
W71-07248 01B

IONIZATION
ION PAIRING IN 2 2 COMPLEX ION ELECTROLYTES (CO(NH3)5NO2)SO4,
W71-07248 01B

IONS
SHARK PIT ORGANS RESPONSE TO CHEMICALS,
W71-07347 05C

IRON
PROPYLENE CARBONATE EXTRACTION OF TRIS (PENTAN-2, 4-DIONE IRON (III) FROM AQUEOUS SOLUTION APPLICATION TO THE SPECTROPHOTOMETRIC DETERMINATION OF IRON,
W71-07641 02K

ORIGIN OF COLORS AND IRONSTONE BANDS IN THE COLUMBIA FORMATION, MIDDLETOWN-ODESSA AREA, DELWARE,

ROADBANKS
A BILL TO PROVIDE FOR THE CONTROL AND PREVENTION OF POLLUTION, DETERIORATION OF WATER QUALITY, AND DAMAGE TO LANDS AND WATERS RESULTING FROM EROSION TO THE ROADBEDS AND RIGHTS-OF-WAY OF EXISTING STATE, COUNTY, AND OTHER RURAL ROADS AND HIGHWAYS.
W71-07482 06E

ROCK MECHANICS
A NEW METHOD FOR THE DETERMINATION OF DEFORMABILITY IN ROCK MASSES,
W71-07065 08E

A REVIEW OF APPLICATIONS OF THE FINITE ELEMENT METHOD OF ANALYSIS TO PROBLEMS IN SOIL AND ROCK MECHANICS,
W71-07073 08D

STUDIES OF PROPERTIES AND CONDITIONS OF ROCK MASSIFS BY SEISMIC ACOUSTICS METHODS,
W71-07074 08E

ROCK PROPERTIES
A NEW METHOD FOR THE DETERMINATION OF DEFORMABILITY IN ROCK MASSES,
W71-07065 08E

STUDIES OF PROPERTIES AND CONDITIONS OF ROCK MASSIFS BY SEISMIC ACOUSTICS METHODS,
W71-07074 08E

ROCK TESTS
STUDIES OF PROPERTIES AND CONDITIONS OF ROCK MASSIFS BY SEISMIC ACOUSTICS METHODS,
W71-07074 08E

ROCKS
DETERMINATION OF IN SITU HYDRAULIC PARAMETERS IN JOINTED ROCK,
W71-07075 02F

ROOT DEVELOPMENT
ROOT ELONGATION RATES OF COTTON AND PEANUTS AS A FUNCTION SOIL STRENGTH AND SOIL WATER CONTENT,
W71-07157 02G

ROTENONE
EFFECTS OF ROTENONE ON ZOOPLANKTON COMMUNITIES AND A STUDY OF THEIR RECOVERY PATTERNS IN TWO MOUNTAIN LAKES IN ALBERT
W71-07353 05C

ROUGHNESS(HYDRAULIC)
EFFECTS OF MECHANICAL CLEANING OPERATIONS ON FLOW IN LARGE CONDUITS,
W71-07615 08B

ROYALTIES
GONSOULIN V SHELL OIL CO (ESTOPPEL BY CONTRACT AS APPLICA TO MINERAL LEASES).
W71-07432 06E

RUBBER
SOURCES OF COMPOUNDS INTERFERING WITH THE ANALYSIS OF EXTRACTS FOR DIELDRIN AND DDT BY GLC,
W71-07397 05A

RULE-AND-LIMITATION
REGULATION OF GREAT LAKES LEVELS AND FLOWS,
W71-07572 02H

RUMINANTS
FEEDING VALUE OF ANIMAL WASTES,
W71-07544 05G

RUNOFF
POSSIBLE SELECTIVE MECHANISMS IN THE DEVELOPMENT OF INSECTICIDE-RESISTANT FISH,
W71-07143 05C

SOURCES OF COMPOUNDS INTERFERING WITH THE ANALYSIS OF EXTRACTS FOR DIELDRIN AND DDT BY GLC,
W71-07397 05A

A METHOD FOR FORECASTING SPRING RUNOFF FROM RIVERS IN TH DNIESTER BASIN (METODIKA PROGNOZA VESENNEGO STOKA REK BASSEYNA DNESTRA),
W71-07651 02E

DRY-WEATHER FLOW OF TRANSCARPATHIAN MOUNTAIN RIVERS (RUSSIAN MEZHENNY STOK GORNYKH REK ZAKARPAT'YA),
W71-07654 02E

RUNOFF FORECASTING
HYDROLOGIC STUDIES AND COMPUTATIONS (GIDROLOGICHESKIYE ISSLEDOVANIYA I RASCHETY),
W71-07647 02E

A METHOD FOR FORECASTING SPRING RUNOFF FROM RIVERS IN TH DNIESTER BASIN (METODIKA PROGNOZA VESENNEGO STOKA REK BASSEYNA DNESTRA),
W71-07651 02E

RURAL AREAS
A FIELD STUDY OF THE PERFORMANCE OF WASTE STABILIZATION PONDS SERVING SMALL TOWNS,
W71-07127 05D

SALAMONIE DAM
SALAMONIE DAM FLIP BUCKET PROTOTYPE TESTS, SALAMONIE RIV INDIANA,
W71-07177 08B

SALINE WATER
SALINE WATER CONVERSION PROGRAM--APPROPRIATION.
W71-07491 06E

SALINE WATER INTRUSION
CALCASIEU SALTWATER BARRIER, PROTOTYPE SECTOR GATE TESTS
W71-07178 08A

SALINITY
A DETAILED ANALYSIS OF CLIMATOLOGICAL AND HYDROLOGICAL RECORDS OF SOUTH FLORIDA WITH REFERENCE TO MAN'S INFLUE UPON ECOSYSTEM EVOLUTION,
W71-07672 02A

SALMON
RETENTION OF MERCURY BY SALMON,
W71-07433 05A

SAMPLING
PERIODIC REPORT OF THE WATER QUALITY SURVEILLANCE NETWO 1965 THRU 1967 WATER YEARS.
W71-07635 05A

SAN FERNANDO EARTHQUAKE(1971)
THE SAN FERNANDO, CALIFORNIA, EARTHQUAKE OF FEBRUARY 9, 1971.

971-07659 08D

LANDSLIDING IN THE VICINITY OF THE VAN NORMAN LAKES,
971-07660 08D

WATER RESOURCES ASPECTS,
971-07661 08D

DAMAGE TO CONSTRUCTED WORKS, ASSOCIATED WITH SOIL MOVEMENTS AND FOUNDATION FAILURES,
971-07662 08D

DAMAGE TO WATER SUPPLY SYSTEMS,
971-07663 08D

N FERNANDO(CALIF)
THE SAN FERNANDO, CALIFORNIA, EARTHQUAKE OF FEBRUARY 9, 1971.
971-07659 08D

LANDSLIDING IN THE VICINITY OF THE VAN NORMAN LAKES,
971-07660 08D

WATER RESOURCES ASPECTS,
971-07661 08D

DAMAGE TO CONSTRUCTED WORKS, ASSOCIATED WITH SOIL MOVEMENTS AND FOUNDATION FAILURES,
971-07662 08D

DAMAGE TO WATER SUPPLY SYSTEMS,
971-07663 08D

N FRANCISCO BAY PLAN
THE SAN FRANCISCO BAY PLAN COMBINING POLICY WITH POLICE POWER,
971-07316 06E

N FRANCISCO PLANNING AND URBAN RENEWAL ASSOCIATION
THE SAN FRANCISCO BAY PLAN COMBINING POLICY WITH POLICE POWER,
971-07316 06E

N JOAQUIN RIVER
EFFECTS OF OXIDATION POND EFFLUENT ON RECEIVING WATER IN THE SAN JOAQUIN RIVER ESTUARY,
971-07098 05D

N JOAQUIN VALLEY(CALIF)
INFORMATION FOR THE FUTURE THE WEST SIDE SAN JOAQUIN VALLEY PROJECT.
971-07241 06B

ND FRACTION
GRAIN SIZE RESULTS AND COMPOSITION OF THE SAND FRACTION, LEG 6,
971-07290 02J

NITARY HISTORY OF CHICAGO
THE SANITARY HISTORY OF CHICAGO,
971-07696 05G

NTA BARBARA OIL SPILL
AN INVESTIGATION OF ELEPHANT SEAL AND SEA LION MORTALITY ON SAN MIGUEL ISLAND,
971-07344 05C

NTA BARBARA(CALIF)
POLLUTION CONTROL AT A MAJOR OIL SPILL,
971-07644 05G

TURATED SOILS
MEASURING THE HYDRAULIC POTENTIAL OF GROUNDWATER WITH THE HYDRAULIC POTENTIAL PROBE,
971-07630 07B

TURATION
PREDICTION OF SATURATION PRECIPITATION OF LOW SOLUBILITY INORGANIC SALTS FROM SUBSURFACE WATERS UNDER CONDITIONS OF TOTAL CONCENTRATION, TEMPERATURE AND PRESSURE,
971-07249 02K

LUID-CARBON COLUMNS FOR SORPTION OF RESISTENT ORGANIC POLLUTANTS,
71-07374 05D

TLAND
MARINE SHELL RADIOCARBON DATES AND THE CHRONOLOGY OF DEGLACIATION IN WESTERN SCOTLAND,
971-07262 02J

EENS
STORM WATER/SEWAGE CONTROL,
971-07528 05D

LEVEL
DETAILED ANALYSIS OF CLIMATOLOGICAL AND HYDROLOGICAL RECORDS OF SOUTH FLORIDA WITH REFERENCE TO MAN'S INFLUENCE UPON ECOSYSTEM EVOLUTION,
971-07672 02A

LIONS
AN INVESTIGATION OF ELEPHANT SEAL AND SEA LION MORTALITY ON SAN MIGUEL ISLAND,
971-07344 05C

WATER
THE USE OF ULTRA-VIOLET ABSORPTION MEASUREMENTS FOR THE ESTIMATION OF ORGANIC POLLUTION IN INSHORE SEA WATERS,
971-07256 05A

MERCURY IN THE MARINE ENVIRONMENT,
W71-07328 05C

HYDROGRAPHIC OBSERVATIONS ON THE RED SEA BRINES INDICATE A MARKED INCREASE IN TEMPERATURE,
W71-07604 07C

SEALS
AN INVESTIGATION OF ELEPHANT SEAL AND SEA LION MORTALITY ON SAN MIGUEL ISLAND,
W71-07344 05C

SEASONAL
ESTIMATING THE EXTENT OF RIVER SLUSH ICE (K VOPROSU OB OTSENKE STEPENI SHUGONOSNOSTI REK),
W71-07656 02E

SECTOR GATES
CALCASIEU SALTWATER BARRIER, PROTOTYPE SECTOR GATE TESTS,
W71-07178 08A

SEDIMENT CONTROL
A BILL TO PROVIDE FOR THE CONTROL AND PREVENTION OF POLLUTION, DETERIORATION OF WATER QUALITY, AND DAMAGE TO LANDS AND WATERS RESULTING FROM EROSION TO THE ROADBEDS AND RIGHTS-OF-WAY OF EXISTING STATE, COUNTY, AND OTHER RURAL ROADS AND HIGHWAYS.
W71-07482 06E

SEDIMENT TRANSPORT
BED LOAD TRANSPORTATION IN ALLUVIAL CHANNELS,
W71-07613 02J

SEDIMENT YIELD
EROSION RATES IN THE STEVEVILLE BADLANDS, ALBERTA,
W71-07165 02J

SEDIMENTATION
MARINE SHELL RADIOCARBON DATES AND THE CHRONOLOGY OF DEGLACIATION IN WESTERN SCOTLAND,
W71-07262 02J

HYDRAULIC AND REMOVAL EFFICIENCIES IN SEDIMENTATION BASINS,
W71-07362 05D

DISCUSSION OF 'HYDRAULIC AND REMOVAL EFFICIENCIES IN SEDIMENTATION BASINS,'
W71-07363 05D

HOLOCENE SEDIMENTATION RATES IN OVERBANK DEPOSITS IN THE BLACK BOTTOM OF THE LOWER OHIO RIVER, SOUTHERN ILLINOIS,
W71-07606 02J

SEDIMENTATION BASIN
TREATMENT PLANT WASTE DISPOSAL IN VIRGINIA,
W71-07466 05F

SEDIMENTATION RATES
HOLOCENE SEDIMENTATION RATES IN OVERBANK DEPOSITS IN THE BLACK BOTTOM OF THE LOWER OHIO RIVER, SOUTHERN ILLINOIS,
W71-07606 02J

SEDIMENTOLOGY
FATTY ACID DIAGENESIS IN RECENT SEDIMENT FROM NARRAGANSETT BAY, RHODE ISLAND,
W71-07261 02J

GRAIN SIZE RESULTS AND COMPOSITION OF THE SAND FRACTION, LEG 6,
W71-07290 02J

SEDIMENTOLOGY SYNTHESIS LITHOLOGY, CHEMISTRY AND PHYSICAL PROPERTIES OF SEDIMENTS IN THE NORTHWESTERN PACIFIC OCEAN,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA-Water Quality Office, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.

Supported by the Environmental Protection Agency in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Agricultural livestock wastes at the Department of Agricultural Engineering of Iowa State University.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Water Quality Office of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.
- Water treatment plant waste pollution control at American Water Works Association Research Foundation.

SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
OCT 7 1971
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 4, NUMBER 15
AUGUST 1, 1971

W71-07702 -- W71-08321

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 15
AUGUST 1, 1971

W71-07702 -- W71-08321

se of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency, Water Quality Office. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

purpose of this monograph is to analyze the n's water balance and to examine its role in-ing the earth's surface and conditions for an life. Global hydrology, as a branch of ral hydrology, embraces such problems as (1) y of the water cycle and influence of human ac- on it; (2) spatial-temporal analysis of ologic processes for vast areas and for the n as a whole; (3) development of deterministic statistical patterns in the fluctuations of ologic processes; (4) identification of zones of hronous and asynchronous variations in ru- (5) paleographic reconstructions of the n's water regime; (6) long-range forecasts of tate of earth's water resources and their effects evelopment of processes taking place on earth; (7) study of the interrelationship of natural rs and formulation of scientific principles for rolling the water regime of vast areas. The ng section stresses the need for promoting in-ational cooperation among scientists in the of hydrology. (Josefson-USGS)

EFFECTS OF CHANNEL CHARACTERISTICS ON TIME PARAMETERS FOR SMALL WATERSHED RUNOFF HYDROGRAPHS,
Minnesota Univ., Minneapolis. Water Resources Research Center.
P. Golany, and C. L. Larson.
Available from the National Technical Information Service as PB-199 373, $3.00 in paper copy, $0.95 in microfiche. Minnesota, Water Resources Research Center, Bulletin 31, 1971. 130 p, 48 fig, 38 tab, 47 ref. OWRR Project No: B-007-MINN (5).

Descriptors: *Rainfall-runoff relationships, *Mathematical model, *Peak discharges, Watershed, Hydrographs, Storm runoff, Routing, Computer, Overland flow, Channels.
Identifiers: *Time parameters, *Time to equilibrium, *Watershed model, Time of concentration, Time to peak, Lag time.

Most, if not all, parametric methods for predicting peak runoff from small watersheds require some type of time parameter as part of the runoff routing. The effects of watershed characteristics such as length, slope and roughness of the main channel and watershed area on time parameters were investigated in this study. A mathematical model and a computer program were developed for solving the dynamic equations of continuity and momentum to route nonsteady runoff through a channel system. A theoretical equation for computing the time to virtual equilibrium (time required for the rate of runoff at the outlet to become equal to the supply rate) was derived. The results of the research indicate the relative effect of the overland flow on the time to virtual equilibrium of the watershed decreases as the watershed size increases, and vice versa. The time to virtual equilibrium decreases as the supply rate increases and the non-linearity of the runoff process is shown. (Walton-Minnesota)

2B. Precipitation

THE WORLD DISTRIBUTION OF ANNUAL PRECIPITATION EFFICIENCY,
Victoria Univ. (British Columbia).
Stanton E. Tuller.
Journal of Geography, Vol 70, No 4, p 219-223, Apr 1971. 2 fig, 1 tab, 7 ref.

Descriptors: *Climatic data, *Precipitable water, *Water vapor, *Precipitation (Atmospheric), *Climatic zones, Deserts, Meteorology, Weather data, Temperature, Tropical regions, Evaporation, Condensation, Synoptic analysis.
Identifiers: *Precipitation efficiency, *Dynamic precipitation mechanisms.

The atmospheric water vapor, acted upon by dynamic precipitation mechanisms, is the source of precipitation. The greater the precipitable atmospheric water vapor, the greater the latent heat supply available for the maintenance of precipitation. The amount increases with temperature and proximity to evaporative moisture sources and decreases with altitude. The maximum amounts are found over tropical oceans and decrease toward land, toward higher mountains and toward the poles. A world map of mean precipitable water vapor shows that it is poorly correlated with recorded precipitation. Some of the worlds major deserts have annual mean precipitable water vapor greater than Europe or most of the U.S. It therefore follows that the key to precipitation lies more with the active precipitation mechanisms which will cause the necessary lifting, cooling, condensation and droplet formation. Precipitation efficiency is the ratio of average daily precipitation divided by the mean precipitable water vapor, which gives an indication of relative atmospheric stability with time. It has been a neglected concept, until recently, because there was little available data on precipitable water vapor. A world map of precipitation efficiency is presented and discussed. High indexes are associated with regions of atmospheric instability and low indexes with atmospheric stability. (Casey-Arizona)

THE STRUCTURE OF THUNDERSTORM RAINFALL,
Illinois State Water Survey, Urbana.
John B. Stall, and Floyd A. Huff.
Meeting Preprint 1330, American Society Civil Engineers National Water Resources Engineering Meeting, Jan 11-15, 1971, Phoenix, Ariz. 29 p, 12 fig, 7 tab, 17 ref.

Descriptors: *Thunderstorms, *Rainfall, *Storm structure, *Illinois, Radar, Cloudbursts, Flash floods, Runoff, Cloud physics, Rain gages, Peak discharge.
Identifiers: *Urban hydrology, *Chicago.

In the Midwest, heavy storm rainfall occurs most frequently from thunderstorm cells. The rain cell reaching the ground has a diameter of 3 to 6 miles, and area of 15 to 30 square miles, moves at a velocity of 20 to 30 miles per hour, and has a duration of 30 to 60 minutes. Most of the rainfall occurs

during the first 10 minutes; it occurs in 2 to 4 bursts, and 2 or 3 cells usually occur together. The resulting dynamic rainfall input onto an urban basin is a matrix in six dimensions of : depth, area, duration, frequency, sequence, and place. In consideration of the possible mean, inherent variability, and skew of each of these six parameters the resulting matrix is almost impossible to evaluate. Illustration are given of five traditional, two-dimensional plots dealing with various pairs of these six parameters or dimensions. Using point rainfall data for north-central Illinois, the Road Research Hydrograph Method is used for an urban basin in Chicago to show the effect of rainfall variability on the resulting flood runoff hydrograph. FREQUENCY ANALYSIS OF RAINFALL INTENSITIES FOR BOMBAY (COLABA),
Maharshtra Krishi Vidyapeeth (India). Dept. of Agricultural Engineering; and College of Agriculture, Poona (India). Dept. of Agricultural Engineering.
A. I. Patel, and S. S. Vanjari.
Journal of Soil and Water Conservation in India, Vol 18, Nos 1 and 2, p 13-21, 1969. 9 p, 2 fig, 2 tab, 24 ref.

Descriptors: *Rainfall intensity, *Depth-area-duration analysis, *Frequency analysis, Data collections, Runoff forecasting, Rational formula, Rain gages, Statistical methods.
Identifiers: *India, Bombay (India).

Rainfall records of Bombay (Colaba Observatory) were analyzed to develop rainfall intensity-duration-frequency curves. For this purpose frequency analysis of rainfall data over a period of 35 years from 1933 to 1967 was carried out using the Gumbel technique. Annual maximum rainfall intensities for each of the ten durations were calculated by analysis of self recording raingage charts. The extended duration principle was applied wherever data for longer durations were not available. Fisher-Tippett type I extreme value distribution was assumed to provide an acceptable fit to the data. Rainfall intensity-frequency curves for 5 minute, 10 minute, 15 minute, 30 minute, 1 hour, 2 hour, 4 hour, 8 hour, 16 hour, and 24 hour durations were developed. The length of record can be considered to be adequate when determined by applying Student's 't' at the 10% level of significance. (Knapp-USGS)
W71-08070

A STUDY OF THE RAINFALL OF THE LOWER GANGETIC BASIN FOR VARIOUS DURATIONS AND RETURN PERIODS,
Meteorological Office, New Delhi (India).
P. S. Harihara Ayyar, and B. L. Sharma.
Indian Geohydrology, Vol 5, No 1, p 11-25, Dec 1969. 15 p, 4 fig, 18 ref.

Descriptors: *Duration curves, *Depth-area-duration analysis, *Runoff forecasting, Distribution patterns, Hydrologic data, Mapping, Rainfall disposition, Irrigation water, Monsoons, Regions, Synoptic analysis.
Identifiers: *India, *Gangetic Basin (India).

A study of rainfall for one hour and 24-hour duration has been attempted for the lower Gangetic Basin of India, using Gumbel's Extreme values method. The magnitudes of rainfall likely to be reached or exceeded in one hour and 24 hours for various return periods are presented in the form of maps. About 80% of the area in the basin is arable. The annual rainfall of the area ranges between 110 and 170 centimeters. The rainfall generally decreases from the south-east to the north-west. The four monsoon months, June to September, constitute the main rainy season for the basin. However, appreciable rainfall occurs in the months of May and October. (Knapp-USGS)
W71-08094

FLOOD PRODUCING RAINSTORMS IN ASSAM AND ASSOCIATED METEOROLOGICAL CONDITIONS,
Meteorological Office, New Delhi (India).
P. S. Pant, S. D. S. Abbi, D. K. Gupta, and Harish Chandra.
Indian Geohydrology, Vol 5, No 1, p 26-43, Dec 1969. 18 p, 6 fig, 4 tab, 3 ref.

Descriptors: *Rainfall-runoff relationships, *Design storm, *Monsoons, *Synoptic analysis, *Duration curves, Depth-area-duration analysis, Hydrologic data, Flood forecasting, Runoff forecasting, Rainfall disposition, Distribution patterns.
Identifiers: Assam (India).

More than 100 rainstorms of durations ranging from 1-day to 7-day during the period 1901-1960 over the Brahmaputra Catchment in the Assam Plains of India were studied by the Isohyetal method. Enveloping curves of maximum depths for various durations are presented and discussed. Preferred regions for occurrence of concentrated rainfall were located. The synoptic situations associated with some of the flood producing heavy storms are also discussed. Rainstorms are most frequent in the month of June. Most of the storms are of duration of 2-4 days. The synoptic situation which is associated with the maximum number of storms is the extension of the eastern end of the monsoon trough over Assam. Preferred areas for occurrence of storms are all in the northern part of the catchment close to the foot hills. (Knapp-USGS)

USU TELEMETERING PRECIPITATION GAGE NETWORK,
Utah State Univ., Logan. Coll. of Engineering.
C. Earl Israelsen, and Don L. Griffin.
Bureau of Reclamation Contract 14-06-D-6003. Utah Water Research Laboratory Report PRWG 39-7, Apr 1969. 39 p, 2 tab, 8 fig, 1 ref.

Descriptors: *Network design, *Climatic data, *Precipitation, *Telemetry, *Remote sensing, Utah, Wyoming, Idaho, Precipitation gages, Instrumentation, Data collections, Data processing, Data storage and retrieval, Monitoring, Data transmission, Sites, Installation, Operation and maintenance.
Identifiers: Wasatch Weather Modification Project, Automatic Readout Console.

A network of telemetering precipitation gages, operating in mountainous northern Utah, western Wyoming and southern Idaho, is part of Wasatch Weather Modification Project. About 40 gages collected and reported data in the 1968-69 winter from up to 130 miles. The system includes an Automatic Readout Console from Mt. Logan to the Utah Water Research Laboratory. The console is the control center for the network, responsible for interrogating, printing, and transmission. Site and gage selection is discussed with non-technical information on installation, operation and maintenance. (See also W71-08132) (Popkin-Arizona)

TELEMETRY SYSTEM MODIFICATIONS AND 1968-69 OPERATION,
Utah State Univ., Logan. Coll. of Engineering.
Duane G. Chadwick.
Bureau of Reclamation Contract 14-06-D-6003. Utah Water Research Laboratory, Report PRWG 30-8, June 1969. 41 p, 7 fig, 4 tab, 4 ref.

Descriptors: *Network design, *Climatic data, *Precipitation, *Telemetry, *Remote sensing, Precipitation gages, Instrumentation, Data collections, Data processing, Data storage and retrieval, Data transmission, Monitoring, Operation and Maintenance, Variability, Failures, Costs.
Identifiers: Wasatch Weather Modification Project

The Wasatch Weather Modification Telemetering System operation is summarized for the winter of 1968-69. The system is the largest known radio-reporting precipitation network in inaccessible mountainous regions. The system operated for about 600 hours from 39 stations. Mean value standard error was 0.016 inch and 0.03 inch of precipitation for the 36-inch and 70-inch capacity precititation cans. Instruments were reliable, with electronic failures, and 5 battery failures. Causes of failures were analyzed and remedied. Telemetering operation costs for the season were $53,913 for direct costs on salaries, $8,665 for current expenses, and $17,098 for taravel, or $79,676 in total. Tables show station locations, operating record, telemetry logs, and estimates of standard error and variance. Figures show station locations, record data, data printout, transducer assembly, accuracy improvements, guide types, and rain-gage assembly. (See also W71-08131) (Popkin-Arizona)

2C. Snow, Ice, and Frost

AN ALGORITHM FOR NEEDLE ICE GROWTH
Michigan Univ., Ann Arbor. Dept. of Geography.
Sam I. Outcalt.
Water Resources Research, Vol 7, No 2, p 399-400, Apr 1971. 7 p, 5 fig, 1 tab, 20 ref.

Descriptors: *Ice, *Frozen soils, *Freezing, *Mathematical models, Thawing, Frost, Frost action, Frost heaving, Heat transfer, Heat budget.
Identifiers: *Needle ice, *Soil ice.

The morphology of needle ice growth is variable owing to entrapment of mineral soil particles, freezing plane depth, and banding. This paper attempts to link these morphologic variations to the needle growth environment by means of a simple algorithm. The algorithm is based on the hypothesis that morphologic variability can be traced to va

y in surface energy transfer, soil water tension, the thermal-hydraulic properties of the near-ace soil layers during needle evolution. (K-p-USGS)

RPHOLOGY AND ABLATION PROCESSES GLACIER ICE,
higan Univ., Ann Arbor. Dept. of Geography.
rt R. Loomis.
Icefield Ranges Research Project Scientific ults, Vol 2, Bushnell, Vivian C., and Ragle, nard H., eds, American Geographical Society, York, and Arctic Institute of North America, ntreal, p 27-31, 1970. 5 p, 5 fig, 11 ref.

criptors: *Glaciers, *Glacial drift, *Ablation, imentation, Sediment transport, Geomorpholo-Sediments, Statistics, Surveys, Melting.
ntifiers: *Kaskawulsh Glacier.

erential ablation on debris-laden glacier ice has been recognized for its importance in produc-ice-cored topographical features. A study of tion rates on a medial moraine of the hawulsh Glacier is used in conjunction with ice-data and an equilibrium hypothesis of mass ement in the debris mantle to explain the phological form that the moraine assumes. At broad head of the moraine, topographic relief er the thin moraine cover is low. In a downgla-direction, the relief increases along the aine as the debris band narrows under the ef-s of lateral compression of ice along the junc-of the two ice arms. At the same time the till r thickens and ablation rates decrease. After a summer-melt seasons, the differential ablation rring between the ice of the ice core below the aine's debris mantle and the clean ice of the ad-nt glacier arms creates a prominent ice-cored aine ridge standing above the surrounding gla-surface. The combination of slope steepening ice-flow extension results in thinning and ading of the debris veneer, particularly along central ridge of the moraine. (Knapp-USGS)

E COLLAPSE OF SOLIFLUCTION LOBES A FACTOR IN VEGETATION OCKFIELDS,
tland State Univ., Oregon. Dept. of Geography.
ry W. Price.
ncial assistance for research was provided by Arctic Inst of North America. This report previ-y appeared in Arctic, Vol 22, p 395-402, 1969.
Icefield Ranges Research Project Scientific ults, Vol 2, Bushnell, Vivian C, and Ragle, nard H, eds, American Geographical Society, York, and Arctic Institute of North America, ntreal, p 103-107, 1970. 5 p, 5 fig, 9 ref.

criptors: *Solifluction, *Glaciers, *Glacial , *Soil formation, Soil-water-plant relation-s, Sedimentation, Vegetation establishment, morphology.
ntifiers: *Blockfields, *Felsenmeer.

development of soil and vegetation in kfields through normal processes is very slow. surprising, therefore, to find in the Ruby Range outhwest Yukon Territory, tongues and islands egetation occurring amidst certain blockfields. collapse of solifluction lobes from upslope is gested as the mechanism responsible. The lobes from the more gentle solifluction slope of the onto the steeper slope of the blockfields, and ntually become unable to maintain themselves ause of steeper slope, change in composition of etation, and deeper active layer. Once the lobes collapse, they flow downslope carrying with n clumps of vegetation which may become blished somewhere along the mudflow channel evee. In this way small outposts of vegetation created and speed up a process which would erwise take indeterminately longer. (Knapp-GS)

SEISMIC INVESTIGATION OF ICE PROPERTIES AND BEDROCK TOPOGRAPHY AT THE CONFLUENCE OF THE NORTH AND CENTRAL ARMS OF THE KASKAWULSH GLACIER,
Ohio State Univ., Columbus. Inst. of Polar Studies.
Gilbert Dewart.
In: Icefield Ranges Research Project Scientific Results, Vol 2, Bushnell, Vivian C, and Ragle, Richard H, eds, American Geographical Society, New York, and Arctic Institute of North America, Montreal, p 77-102, 1970. 26 p, 21 fig, 7 tab, 49 ref, append.

Descriptors: *Seismic studies, *Glaciers, *Ice, *Topography, Subsurface investigations, Structural geology, Movement, Crystallography, Seismic properties.
Identifiers: *Ice properties, *Kaskawulsh Glacier.

Seismic velocity inhomogeneity and anisotropy were studied in strongly deformed glacier ice, and the form and dimensions of that part of a subglacial valley where two large temperate glaciers merge were determined. The investigations were carried out during the summers of 1964 and 1965 at the confluence of the north and central arms of the Kaskawulsh Glacier in the St. Elias Mountains. According to the results of wide-angle seismic reflection measurements the mean vertical P-wave velocity in the glacier is 3.70 km/sec. At depths of 10-100 m the mean P-wave velocity is 3.63 km/sec, S-wave velocity is 1.74 km/sec and Poisson's ratio is 0.350. From 10-m depth to the surface the velocities of P and S waves decrease markedly to approximately 3.0 km/sec and 1.5 km/sec, respectively. It appears that velocity anisotropy is caused mainly by the foliation structure of alternating layers of clear and bubbly ice. When foliation is strong, velocity anisotropy from this cause predominates over velocity anisotropy due to crystallographic fabric. Crystallographic fabrics are seldom strong enough to cause significant velocity anisotropy. The greatest depth of ice in the central arm of the glacier and in the combined glacier is about 1000 m. The north arm is somewhat less deep. The base of the ice is lower than the glacier terminus, 40 km downglacier, but no bedrock depression was found at the confluence. Both glacier arms are roughly parabolic in cross section. There is no break in the slope of the valley wall where the glacier surface meets it. The valleys of the two arms merge at approximately the same junction at which the surface movements of the two glaciers merge into a uniform flow. (Knapp-USGS)
W71-07955

DEFORMATION OF SURFACE ICE AT A GLACIER CONFLUENCE, KASKAWULSH GLACIER,
Ohio State Univ., Columbus. Inst. of Polar Studies.
Peter W. Anderton.
In: Icefield Ranges Research Projection Scientific Results, Vol 2, Bushnell, Vivian C, And Ragle, Richard H, eds, American Geographical Society, New York, and Arctic Institute of North America, Montreal, p 59-76, 1970. 18 p, 16 fig, 1 tab, 25 ref.

Descriptors: *Glaciers, *Movement, *Rheology, Velocity, Stress, Strain, Surveys, Structural geology, Petrofabrics.
Identifiers: *Kaskawulsh Glacier, *Ice deformation (Glaciers).

Measurements of surface velocity at the confluence of the north and central arms of the Kaskawulsh Glacier show a progressive change from independent profiles across each arm towards a unified profile across the combined glacier. Strain-rate determinations near the point of confluence show that the surface ice flows through a changing stress field equivalent to simple shear with an increasing component of transverse compression. The stress field across the median line is characterized by dominant transverse compression and concomitant longitudinal extension. Surface structures such as fractures, folds, foliation, and lineation are related to the stress field at the confluence. Changes in optic-axis fabrics of the ice are also correlated with changes in the stress field near the point of confluence. Fabric symmetry probably reflects the symmetry of small-scale movements in the ice, particularly in fabrics where the optic-axis and noncrystallographic subfabrics are closely related in symmetry. (Knapp-USGS)
W71-07956

DENSITY VARIATIONS IN ALPHINE SNOW,
British Columbia Univ., Vancouver. Dept. of Geology.
Donald Alford.
Reprinted from Journal of Glaciology, Vol 6, p 495-503, 1969. In: Icefield Ranges Research Project Scientific Results, Vol 2, Bushnell, Vivian C, and Ragle, Richard H, eds, American Geographical Society, New York, and Arctic Institute of North America, Montreal, p 51-57, 1970. 7 p, 6 fig, 11 ref.

Descriptors: *Snowpacks, *Density, *Distribution patterns, *Density stratification, Temperature, Topography, Snowfall, Firn, Slopes, Snow cover.
Identifiers: *Snowpack density.

Stratigraphic studies of the annual snow layer in the Beartooth Mountains of south-western Montana and on Mount Logan in the St. Elias Range disclose a similar distribution density in the two areas. The average density of the pack, obtained by integrating a series of measurements taken at 5-10 cm vertical intervals over the total thickness of the annual layer, reaches a maximum value near a midpoint of the total elevation covered by each traverse and decreases lineraly toward the elevation extremes. A preliminary hypothesis relates the distribution of average snow-density values along slopes to a semi-stable zonation of near-surface air temperatures. (Knapp-USGS)

Descriptors: *Snow, *Optical properties, *Refractivity, Absorption, Remote sensing, Snow surveys, Ice, Solar radiation, Snowpacks, Albedo, Snowmelt.

Spectral extinction measurements for the visual range were made on homogeneous snow samples prepared under controlled conditions, with snow density and grain size as variables. Comparative measurements were made on coarse-grained natural snow. Extinction coefficient was in the range 0.8 to 1.7 for fine-grained dense snow, and 0.16 to 0.37 for the coarse-grained snow. In the fine-grained snow, where scattering is thought to be the dominant attenuating process, there is a general decline of the coefficient as wavelength increases from 0.4 to 0.7 microns. In the coarse-grained snow, where absorption becomes significant, spectral selection was slight, with a weak minimum in the region 0.5 to 0.6 microns. For a given density the coefficient decreases as grain size increases, the rate of change varying with wavelength. Spectral reflectance measurements on natural snow are reported, and attenuation data are interpreted to give surface reflectivity for fine-grained snow. Diffuse reflection from fine-grained snow is believed to have little spectral dependence in the visual range, but with coarse-grained snow reflectance is expected to become inversely dependent on wavelength. It is suggested that optical principles might be applied in the measurement of snow structure, and also for remote sensing of snow-covered terrain. (Knapp-USGS)

STRATIGRAPHIC STUDIES OF THE WINTER SNOW LAYER, MOUNT LOGAN, SAINT ELIAS RANGE,
Montana State Univ., Bozeman, and Army Cold Regions Research and Engineering Lab., Hanover, N.H.
Donald Alford, and Charles Keeler.
Reprinted from Arctic, Vol 21, p 245-254, 1969. In: Icefield Ranges Research Project Scientific Results, Vol 2, Bushnell, Vivian C, and Ragle, Richard H, eds, American Geographical Society, New York, and Arctic Institute of North America, Montreal, p 37-42, 1970. 6 p, 5 fig, 1 tab, 10 ref.

Descriptors: *Snow, *Stratigraphy, Snow cover, Surveys, Firn, Profiles, Cross-sections, Climatology, Topography.
Identifiers: *Mount Logan.

A traverse study was made of near-surface snow properties in the King Trench area of Mount Logan, St. Elias Range. Based upon the assumption that these snow properties are related to thermodynamic processes operating during the depositional period, a climatological model of the King Trench relates the observed variations in snow properties along the traverse line to localized topographic obstruction or enhancement of katabatic air drainage. The near-surface climate of snow-covered slopes generally may be inferred partially from the interaction between local topography and katabatic flow. (Knapp-USGS)

MICROCLIMATOLOGICAL STUDIES OVER THE SEWARD GLACIER SNOWPACK,
Michigan Univ., Ann Arbor. Dept. of Geography.
Ray Lougeay.
In: Icefield Ranges Research Project Scientific Results, Vol 2, Bushnell, Vivian C, and Rangle, Richard H, eds, American Geographical Society, New York, and Arctic Institute of North America, Montreal, p 17-26, 1970. 10 p, 5 fig, 7 tab, 24 ref.

Descriptors: *Microclimatology, *Glaciers, *Micrometeorology, *Air circulation, Winds, Meteorology, Regimen, Data collections, Instrumentation, Meteorological data, Solar radiation, Alaska, Weather.
Identifiers: *Icefield ranges, *Seward Glacier.

Microclimatic observations for a ten-day period in the summer of 1965 on the upper Seward Glacier show that wind profiles closely approximate log-linear curves, as would be expected under the stable conditions characteristic of the period. Temperature profiles have a distinct double inversion pattern during daytime hours. Net radiation is the dominant heat source during each day of the period, whereas sensible and latent heat fluxes were almost insignificant due to low wind speeds and limited temperature ranges, with temperatures generally close to 0 deg C. SNOW PREDICTION IN THE EASTERN UNITED STATES,
New York Univ., Bronx. School of Engineering and Science.
Jerome Spar, Edward A. Brandes, and Joseph N. Grillo.
Available from the National Technical Information Service as COM 71-00103, $3.00 in paper copy, $0.95 in microfiche. New York University, School of Engineering and Science, Geophysical Sciences Laboratory Report No TR-70-11, July 1970. ESSA Contract No E-4-70 (N).

Descriptors: *Synoptic analysis, *Forecasting, *Snow, *Snowfall, *Cities, Meteorology, Surveys, Reviews, Weather forecasting, Rainfall, Precipitation (Atmospheric).
Identifiers: *Urban hydrology, *Snow forecasting.

A climatological approach to the translation of synoptic-scale predictions of winter precipitation into mesoscale information was applied to the problem of rain-snow discrimination in the New York metropolitan area. The synoptic conditions necessary for the occurrence of heavy snow on the east coastal plain show no obvious characteristic antecedent patterns either 24 or 12 hours prior to onset of snow, and a wide diversity of patterns even at and after onset time. Localized hourly numerical forecasts generated through spatial interpolation by the Shuman primitive equation model for the 1969-1970 winter season are evaluated for seven eastern cities, and are found to predict precipitation occurrences too infrequently and too late. This systematic error appears to be due, at least in part, to the method of interpolating precipitation. The results of the snow prediction project are reviewed from the viewpoint of forecast application. (Knapp-USGS)

SUMMARY OF SNOW SURVEY MEASUREMENTS FOR ARIZONA AND PERTINENT PORTIONS OF NEW MEXICO 1939-1970,
Soil Conservation Service, Phoenix, Ariz.
Richard W. Enz.
Soil Conservation Service Cooperative Snow Survey Report, 1970. 73 p.

Descriptors: *Snow surveys, *Arizona, *Colorado River basin, *Snow cover, Water equivalent, Soil moisture, Sampling, Methodology, Data collections, Hydrologic data, Streamflow forecasting, Water yield, Runoff forecasting, Water management (Applied).

Summarized are all snow survey measurements made in Arizona and western New Mexico from 1938 through 1970 for which records are available. This report superseded all previous Arizona summaries, as all data has been carefully checked and notes corrected to eliminate sampling errors. Some snow courses have been shortened since the 1964 summary, so there may be slight changes from the previously published record. Snow survey activities in Arizona started in 1937 with the establishment of six snow courses along the Coronado Trail near Alpine. These are all still active and used in forecasting the Salt and San Francisco Rivers. Throughout the years, many more courses were added to provide better sampling distribution. At present there are 55 active snow courses on the major watersheds of the state. Eight of these are located on the Gila River headwaters in New Mexico. After all sample points have been measured, the depth of snow and water content columns are totaled and then divided by the number of samples to obtain average snow depth and average water content. NEO-PLEISTOCENE CHANGES IN A LARG RIVER VALLEY USING THE ODER AS A EXAMPLE,
Wroclaw Univ. (Poland). Inst. of Geography.
Stanislaw Szczepankiewicz.
Geographia Polonica, No 14, p 23-33, 1968. 11 4 fig, 13 ref.

Descriptors: *Pleistocene epoch, *Glaciatio *Glacial drift, *Ice, *Erosion, Geologic time, R noff, Valleys, Topography, Profiles, Sedimentatio Geomorphology, Terraces (Geological), Sand Gravels, Loess.
Identifiers: *Poland, Oder River, Neo-Pleistoce relief, Inland ice, Aeolian processes.

In the Neo-Pleistocene relief of proximal valley several sections can be distinguished which differ the evolution of their forms of accumulation a erosion. In the zone between the fringe of the La Glaciation and the maximum range of glaciatio no ice marginal valley of a continuous character e ists; water runoff in a variety of directions is t rule, dictated by the ancient valley networ Results of the study show that in many instanc there is lack of evidence for establishing uniformi between right and left bank forms of relief, partic larly with respect to longitudinal profiles of riv valleys. The range of the Neo-Pleistocene glac tions clearly indicates a noncontinuity. Besides c matic and tectonic conditions, evolution of tra verse and longitudinal valley profiles in the regio depends, among other things, upon local sedime tation. The Oder Valley may be viewed as a uniq model for river valleys whose floors are orient proximally with respect to movement of inland i and which are situated within the range of t Pleistocene glaciations. Descriptors: *Evaporation, *Evapotranspiration, *Irrigated land, *Advection, *California, Methodology, Meteorological data, Instrumentation, Lysimeters, Infrared radiation, Winds, Model studies, Data collections, Latent heat, Vegetation, Soil-water-plant relationships.

Detailed micrometeorological data were collected during three periods in October 1966 and 1967 at Davis, California when dry northerly winds passed from an extensive dry area onto a moist irrigated grass field. The two studies which comprise this report use these data to test several advection models. Goltz and Pruitt, using 13-14 October 1966 data and three independent methods studied the horizontal extent of the transition zone of surface evaporative flux and the magnitude and variation of evapotranspiration within this zone. The reduction of evapotranspiration 117 meters downwind from the leading edge of an irrigated grass field under conditions of strong advection of cool dry air was 20 to 25 percent, with all three methods providing compatible results. Indications were that even at this distance into the grass field, evapotranspiration reductions had not completely stabilized. Decker, using Philip's model for advection, tested the variation of evapotranspiration over the same irrigated grass field during conditions of mild advection of warm dry air represented by the 7 and 9 October 1967 data. He found that predicted values of surface evapotranspiration during inversion periods compared quite closely to values of evapotranspiration measured by the 20-foot weighing lysimeter located 100 meters downwind in the grass field. During periods without surface temperature inversions, however, the lysimeter evapotranspiration was 20 to 60 percent higher than the evapotranspiration predicted by the advection model. EVAPORATION FROM WATER SURFACES BY DAY AND BY NIGHT,
Marie Curie-Sklodowska Univ., Lublin (Poland). Inst. of Geography.
Edward Michna.
Geographia Polonica, No 14, p 159-164, 1968. 6 p, 3 tab, 9 ref.

Descriptors: *Evaporation, *Air-water interfaces, *Evaporators, *Meteorological data, Instrumentation, Measurement, Seasonal, Diurnal, Nocturnal.
Identifiers: *Poland, Carpathian Mountains, Water surface.

A quantitative determination of the amount of evaporation occurring by day and by night over a full 24-hour period is of great importance for hydrology and climatology. In investigating evaporation from a water surface the most appropriate period for nighttime evaporation must first be decided. The period between sunset and sunrise was picked in the belief that measurements made at the time the sun rises and sets would yield results which illustrate the true amount of evaporation during night and day. Evaporation from a free water surface was measured at the Research Station of the Physical Geography Laboratory of the Curie-Sklodowska University situated at Rownia (Western Bieszczady) and at the Meteorological Station of the State Hydrological and Meteorological Institute at Przemysl (the Carpathian Upland). Although measurements covered only a short period the results obtained indicate that nightly evaporation constitutes a large part of a 24-hour evaporation--particularly in the cooler season. It is believed that measurements of evaporation from water surfaces during the periods indicated yield true values of daytime and nighttime evaporation; calculated per hour of day and night, the values permit comparisons to be made between results obtained at various latitude sites. AN ASPIRATED DIFFUSION POROMETER,
Commonwealth Scientific and Industrial Reasearch Organization, Canberra (Australia). Div. of Land Research; and Australian National Univ., Canberra. Research School of Biological Sciences.
G. F. Byrne, C. W. Rose, and R. O. Slatyer.
Agricultural Meteorology, Vol 7, No 1, Jan 1970. 5 p, 1 fig, 5 ref.

Descriptors: *Instrumentation, *Leaves, *Diffusivity, *Evaporation, Equipment, Measurement, Estimating equations, Resistance.
Identifiers: *Aspirated diffusion porometers, Diagrams.

The large aspirated diffusion porometer for measurement of leaf diffusive dimensions is accurate under laboratory conditions, but field conditions cause temperature gradients within the instrument, impairing its performance. Also, leaves of large dimensions must be used in taking measurements. A porometer designed for field use, which can also take measurements from small leaves, has been developed. The small interior volume of the instrument prevents temperature gradients from developing within it. Three detailed diagrams of the instrument, directions for its use, and formula for calculation of leaf diffusive resistance are included. (Yensen-Arizona)

Identifiers: *West Africa, *Sahara Desert, *Potential evapotranspiration, *Net radiation, *Bowen ratio.

There are many gaps in the current knowledge of radiational processes over the horizontal surface of West Africa. Little radiation data is available for the area and a theoretical model was therefore utilized which was based largely on indirect calculations using ordinary meteorological data. Total solar radiation consists of direct radiation (Q) and diffuse radiation (q). Observed solar radiation (Q and q) could be estimated with an equation utilizing data for maximum possible solar radiation, maximum possible sunshine hours and observed sunshine hours. Mean monthly values of Q and q were then mapped as isolines for West Africa in the months of January and July. Surface solar energy ranges from 500-275 ly/day. In both months, lowest values were along the Guinea coast due to cloud cover, while highest values were along the fringes of the Sahara. Zonal distribution patterns prevailed and are detailed. In July, longer day lengths prevailed, but this was offset by greater cloud cover so that average values were not very different from January. Net radiation (R)— (Q and q) (I-a) - I where a is albedo and I is effective outgoing radiation. Methods are presented for the estimation of I. Maps of R were constructed for alternate months of the year, and temporal and zonal fluctuations are discussed. Definite relationships exist between the heat balance components and both the water balance and hydrological cycle components. Equations are developed relating radiation terms to water balance and hydrological cycle terms. (Casey-Arizona)

SURFACE RUNOFF FROM GRADED LANDS OF LOW SLOPES,
J. M. Laflen, and I. L. Saveson.
Trans Am Soc Agricultural Engrs, Vol 13, No 3, p 340-341, 1970. 4 fig, 2 ref.

Descriptors: *Mathematical studies, *Data collections, *Surface runoff, Estimating equations, Storms, Louisiana.
Identifiers: *Data analysis, Baton Rouge (La).

This paper reports on analysis of surface runoff data collected during 1962, 1963, and 1964 near Baton Rouge, La. The object of the data analysis was to develop reliable prediction equations for estimating peak rate and total amount of surface runoff from any storm. The hypothesis tested was that peak rate and total amount of surface runoff could be expressed as functions of precipitation, row slope, row length, and antecedent soil moisture. Some conclusions drawn from the experiment include: (1) the effect of antecedent soil moisture is independent of precipitation, if the peak rate of runoff is the dependent variable; (2) the effect of slope and length of surface runoff is not independent of precipitation; (3) a single, precipitation - intensity measure is sufficient for expressing the effect of precipitation on peak rate of surface runoff.

A PROPOSAL OF CLASSIFICATION OF VEGETATION HABITATS ON THE BANKS OF CZECHOSLOVAK WATER COURSES FROM THE HYDROLOGICAL STANDPOINT, (IN GERMAN),
Ceskoslovenska Akademie Ved, Prague. Botanicky Ustav.
Karel Kopecky.
English abstract. Archiv fur Hydrobiologie, Vol 66, No 3, p 326-347, 1969. 9 fig, 19 ref.

Descriptors: *Streams, *Rivers, *Banks, *Aquatic plants, *Streamflow, Hydraulics, Water levels, Floodwater, Velocity, Marshes, Flood plains, Erosion, Deposition (Sediments), Classification.

The proposed classification considers the vertical zonality of stream shores, the fluctuation of water level, and the rate of water movement of water courses. Depending on the position of the land and the extent of overflow, limited and broad inundation sites are recognized. Both groups are subdivided into marshes or quagmires, and flood plains of 3 degrees of inundation intensity and duration. The shores of water courses are further subdivided on the basis of the nature of denudation and deposition of eroded material. Within the substrata of comparable nutrient supply and outside the diffusion zone, the described sites support characteristic plant covers. (Wilde-Wisconsin)

An analysis of runoff formation in rivers with a t
lag in excess of one day has established tha
refined genetic runoff formulas depths of daily
flow are determined from water yield for a 2-3
period. The depth of inflow consists of a laye
water yield for which a coefficient may be ca
lated; for approximate computations it may be
sumed that it is between 0 and 0.3. An example
computation is given, which confirms the exped
cy of taking into account the nonsimultaneou
of a slope and channel runoff within a daily
period. For computation purposes, discharge
spring high water from the Kleven' River near S
povka for the year 1940 have been used. (Josef

ollect accurate, independent records of flow e Columbia River at The Dalles, Oregon, an stic streamflow-measuring system was in-d. This device measures velocity of flow by difference in traveltimes of acoustic pulses mitted through the water in each direction a diagonal path across the river. The flow of along the path increases the speed of one and retards the speed of the other. The dif-ce in time of travel is related linearly to the velocity along the path. Installation of the m, which is the first application of an acoustic meter in a large natural channel, was lected in April 1969. It has been in continuous ation since that date. The velocity index and r-surface elevation are used as a two-variable in the computation of flow. These variables, lated against current-meter measurements by use of specialized boat equipment, pro-a reliable basis for computations of instantane-nd daily mean discharges. (Knapp-USGS)

STUDY OF WATERSHED CHARACTERISTICS AFFECTING THE HYDROLOGIC PERFORMANCE,
India Inst. of Tech., Kharagpur. Dept. of Agricultural Engineering; and Soil Conservation Research, Training and Demonstration Center, Ootacmund (India).
N. K. Tyagi, E. Raghunath, and V. Lekhmanan.
Journal of Soil and Water Conservation in India, Vol 18, Nos 1 and 2, p 7-12, Jan-June 1970. 6 p, 6 fig, 1 tab, 6 ref.

Descriptors: *Rainfall-runoff relationships, *Water yield, Topography, Drainage density, Drainage patterns (Geologic), Rainfall disposition.
Identifiers: *India.

The physiographic characteristics of watersheds affecting the peak flows and runoff yield are reviewed and evaluated. Hydrologic performance of two watersheds in the Nilgiris, India, are compared. The two watersheds selected for study show significant difference in runoff yield. The rainfall received by Kallarpallam is only 22% more than Kukkalhariahalla but the runoff is greater by 83%. Due to the insignificant difference in climatic variables the marked variation in hydrologic performance can be attributed only to physiographic factors such as total watershed relief, stream slope and drainage density. (Knapp-USGS)

FLOODS IN THE WAPSIPINICON RIVER BASIN, IOWA,
Geological Survey, Iowa City, Iowa.
Harlan H. Schwob.
Geological Survey Open-file Report, Feb 1971. 52 p, 2 fig, 19 plate, 2 tab, 6 ref.

Descriptors: *Floods, *Flood plains, *Flood forecasting, *Iowa, Hydrologic data, Rainfall-runoff relationships, Stream gages, Flow rates, Peak discharge, Historic flood, Flood control, Regional flood, Data collections.
Identifiers: Flood profiles, Standard Project Flood, Intermediate Regional Flood.

Flood information for 338 miles of the main stem and six tributaries of the Wapsipinicon River, Iowa is reported to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Included are flood-peak records, gaging-station records, frequency curves, and water-surface profiles. Outstanding floods resulting from extremely heavy rainfall occurred in the upper basin in 1968 and 1969. Those in 1968 produced the highest flood of record at the gaging station at Independence. The flood of 26,800 cfs (cubic feet per second) at this station was the greatest in the period 1933-70. A number of the smaller tributaries experienced floods more than five times the computed 50-year flood. No flood of record has exceeded the 50-year flood on the main stem from Anamosa. Flood-profile sheets show actual flood occurrences and computed profiles of the 25- and 50-year floods. A low-water profile and tabulated discharge indicate the range in elevation and discharge along the streams. (Woodard-USGS)

COMPARISON OF DIMENSIONLESS UNIT HYDROGRAPHS IN THAILAND AND TAIWAN,
Colorado State Univ., Fort Collins; and Asian Inst. of Tech., Bangkok (Thailand); and National Energy Authority, Bangkok (Thailand).
Edmund F. Schulz, Subin Pinkayan, and Chumporn Komsartra.
Nordic Hydrology, Vol 2, No 1, p 23-46, 1971. 24 p, 16 fig, 2 tab, 21 ref.

Descriptors: *Unit hydrographs, *Rainfall-runoff relationships, *Mathematical models, Hydrograph analysis, Base flow, Floods, Subsurface runoff, Hydrographs, Peak discharge, Time lag, Tropical regions.
Identifiers: *Thailand, *Taiwan.

The characteristics of dimensionless unit hydrographs were derived from floods from watersheds smaller than 1000 square kilometers in Thailand. These dimensionless unit hydrographs were compared with similar unit hydrographs derived from floods on Taiwan and with the unit hydrographs derived from a mathematical model developed from the theory of the instantaneous unit hydrograph. The unit hydrographs derived from the Thai watersheds had much longer base length and much longer time to peak than similar unit hydrographs derived from floods on Taiwan. This increase in length of response time is attributed to a larger component of subsurface runoff in the floods from tropical watersheds. (Knapp-USGS)

THE BRAHMAPUTRA DRAINAGE SYSTEM AND FLOODS IN THE ASSAM VALLEY,
Assam Directorate of Geology and Mining (India).
K. C. Prasad, and M. N. Talukdar.
Indian Geohydrology, Vol 5, No 1, p 44-49 Dec 1969. 6 p, 2 fig.

Descriptors: *Floods, *Silting, *Rainfall-runoff relationships, *Rivers, *River flow, Hydrographs, Flood forecasting, Flood control, Hydrograph analysis, Flood plains, Earthquakes, River forecasting, Streamflow forecasting, Routing, Watersheds (Basins).
Identifiers: *Brahmaputra River (India), *Assam Valley (India).

The Brahmaputra drainage basin of India has a catchment area of about 423,462 sq.km. falling mostly in the Himalayan, Assam, Naga and Barail Ranges. Precipitation in the entire catchment is heavy. Due to high gradient and drainage density in the catchment area the surface runoff quickly reaches the Brahmaputra, very often causing floods in the alluvial plains of Assam during the monsoon. Because of the earthquake of 1950, the bed of the Brahmaputra was silted up a few meters. This results in frequent spilling of the flood water over the Assam plains. The discharge hydrographs of the Brahmaputra show a very close relation to the rate of precipitation. Recent construction of embankments along the major tributaries of the Brahmaputra helped to enhance discharge and velocity of flow of water along these tributaries. (Knapp-USGS)
W71-08096

A BASIC HYDROLOGIC FORECAST OF THE DISTRIBUTION OF RUNOFF FROM MOUNTAIN RIVERS DURING A GROWING SEASON (RUSSIAN: FONOVYY PROGNOZ RASPREDELENIYA STOKA GORNYKH REK V VEGETATSIONNYY PERIOD),
Moscow State Univ. (USSR).
A. N. Vazhnov.
Meteorologiya i Gidrologiya, No 12, p 59-64, Dec 1970. 6 p, 2 fig, 3 tab, 3 ref.

Descriptors: *Runoff forecasting, *River forecasting, *Runoff coefficient, *Hydrologic data, Distribution patterns, Seasonal, Air circulation, Watersheds (Basins).
Identifiers: *USSR, Caucasus, Runoff distribution.

The forecast of monthly distribution of runoff during the warm season, April through September, is of great value to the irrigation farming regions. To describe the monthly distribution of runoff, the ratio of the runoff during winter high water to the runoff of the following warm period is used. A continuity of atmospheric processes between spring and the preceding winter is assumed in establishing a relationship between variations in runoff distribution within a growing season and the character of atmospheric circulation. Annual values of atmospheric circulation from November through March are expressed as a percentage of the number of days in this five-month period. Given the number of days with meridional and western circulation, one can determine the extent to which the distribution of runoff during a growing season will deviate

from the average distribution for all rivers in question. A basic hydrologic forecast of total runoff for a growing season will also make it possible to obtain absolute monthly runoff values for specific rivers. For developing the forecast, studies were conducted on the Terek River basin at which 15 partial basins with runoff values for a 25-year period (1939-1941 and 1945-1966) were identified. Identifiers: *Ellsworth County (Kans), *Kansas River, *Kansas River basin.

Ellsworth County comprises an area of about 720 square miles. The county lies in the Dissected High Plains section of the Great Plains physiographic province and is drained by the Smoky Hill River and its tributaries and tributaries of the Saline and Arkansas Rivers. The topography slopes generally eastward. The long-term mean precipitation at Ellsworth, the county seat, is 25.66 inches. The Dakota Formation and the Pleistocene deposits in the valleys are the most important aquifers in the county. The lithology most characteristic of the Dakota Formation is gray and greenish-gray siltstone and clay showing red and reddish-brown mottles. These groundwater reservoirs are recharged principally from local precipitation. Yields of properly constructed wells may be in excess of 250 gallons per minute in the most productive areas. The results of chemical analyses indicate that the water generally is suitable for most uses; however, the quality varies considerably from place to place, and locally a large amount of chloride is present. An appendix is included which contains a record of 311 wells and springs located within the county in addition to the well logs of 117 test holes. (Glasby-USGS)

SALINE GROUND-WATERS IN THE CA BONIFEROUS ROCKS OF THE ENGLISH EA MIDLANDS IN RELATION TO THE GEOLOG
Water Resources Board, Reading (England); a
British Petroleum Co., Ltd., London (England).
Richard Allen Dowing, and Frank Howitt.
Quarterly Journal of Engineering Geology, Vo No 4, p 241-269, June 30, 1969. 29 p, 12 fig, 3 t 25 ref, append.

Descriptors: *Hydrogeology, *Groundwater, *C bonate rocks, *Salinity, *Drill holes, Oil indus Water quality, Limestones, Aquifers, Aqu characteristics, Chlorides, Sampling, Chem analysis, Data collections.
Identifiers: *England (East Midlands).

The Carboniferous system in the East Midland England is comprised of a limestone-shale serie a massive limestone (the Carbonifer Limestone) overlain by a cyclic sequence of sa stones, mudstones, seat-earths and coals (the M stone Grit and Coal Measures). The geolog described briefly and modifications are made correlations of the Millstone Grit and Lower C Measures from information obtained by d drilling for oil. Most of the Carboniferous grou waters discussed are saline with total concen tions up to 246,000 mg/l. The concentration i formations increases from the Eakring-Kel Hills area towards Gainsborough, that is from s ne, and the variation in ionic content associ with this increase is discussed. The groundwa are believed to have originated from the diagen of Carboniferous marine and brackish waters possible some Permian marine waters. They probably been concentrated by argillaceous acting as semipermeable membranes and the crease in the Ca/Cl and Mg/Cl ratios as the ionic concentaration increases is probably du the selective concentration of calcium and m nesium ions by argillaceous beds. In the south and south of the East Midlands the saline wate been diluted, probably by meteoric water mo through the aquifers from the outcrop areas discharging into Permo-Triassic rocks, where t overlie Carboniferous aquifers at depth in southeast of the region. Descriptors: *Karst, *Kentucky, *Frac (Geology), *Joints (Geology), Limest Hydrogeology, Groundwater movement, W supply, Water resources development, Re sensing, Aerial photography, Mapping, Survey
Identifiers: *Bryantsville (Ky).

Fracture traces (natural linear features visib aerial photographs), joints, and groundwate currence were studied in detail in a limestone of approximately 48 square miles in the Inner Grass region of Kentucky. Twenty-four hun fracture traces, several hundred joints, and merous wells and springs were related. Fra traces exhibit orientation patterns similar to patterns and form as the result of the enlarge of joints by groundwater solution. Springs u occur along fracture traces, and wells drilled fracture traces encounter solution openin depth. Most subsurface water movement i area is probably along vertical fractures, joints or faults. ar the largest sand-dune area in the Western
isphere, the Sand Hills region of Nebraska is more than 10 times larger than the State of Delaware and almost 3 times the size of Massachusetts. However, unlike other great sand-dune areas of the world, the Nebraska Sand Hills region is not a desert. Not only is its surface stabilized by a grass cover, but beneath it is a thick sequence of permeable rocks filled to overflowing with water. Hundreds of shallow lakes are present, and many streams having remarkably steady rates of flow rise within the region. There exists a considerable potential for additional developments of natural resources. The Ogallala aquifer which forms the High Plains surface, underlies the entire Sand Hills. Currently, the long-term average rate of replenishment is virtually equalled by the long-term average rate of natural discharge. Large quantities of groundwater could be pumped from wells in parts of the Sand Hills region without appreciably diminishing the flow of streams or the amount of water in storage there. Water now being lost to evapotranspiration could be salvaged by pumping. (Knapp-USGS)

LIMESTONE SOLUTION WITHIN THE EAST MENDIP AREA, SOMERSET,
Saskatchewan Univ., Regina. Dept. of Geography.
David Drew.
Cave Research Group of Great Britain Transactions, Vol 12, No 4, p 259-270, Dec 1970. 12 p, 8 fig, 2 tab, 22 ref.

Descriptors: *Underground streams, *Karst, *Limestones, *Dissolved solids, *Water chemistry, Chemical analysis, Caves, Springs, Water temperature, Flow rates, Surface waters, Hydrologic data, Data collections, Groundwater movement, Water quality, Streamflow.
Identifiers: *Sinking streams, *England, Streamflow characteristics.

Measurements of calcium and magnesium carbonate content, pH, saturated pH, temperature and discharge were made at a group of three major resurgences and their associated underground streams on the north flank of Beacon Hill, eastern Mendip, England, over a three-year period. Considerable variations in calcium carbonate content were found between individual sinking streams and between risings. These differences were reflected in temperature and Langelier Index differences. The effects of mixture corrosion and differential supply of carbon dioxide to the water are postulated as possible factors causing these variations. (Woodard-USGS)

AN ELEMENTARY STUDY OF THE CAVE MORPHOLOGY AND SEEPAGE IN THE REYFAD/POLLNACROM SYSTEM, NORTHERN IRELAND,
R. A. Halliwell.
Cave Research Group of Great Britain Transactions, Vol 12, No 4, p 271-281, Dec 1970. 11 p, 3 fig, 3 tab, 16 ref.

Descriptors: *Karst, *Caves, *Rainfall disposition, *Seepage, *Groundwater movement, Gravitational water, Flow rates, On-site investigations, Data collections, Water yield, Analytical techniques, Statistical methods, Rainfall.
Identifiers: *Northern Ireland, *Cave morphology.

Data were collected on cave seepage in County Fermanagh, Northern Ireland, July 1969. The work was done in two parts, a study of the cave morphology and a study of the hydrology. The latter concentrated on the precipitation and its relation to the seepage rates measured in the cave. The sampling points were locations at which water was dripping from the roof. The method of location of drip points was to stand still, listen, and then move towards the sound of the dripping. It was possible to locate a single drip point, identify it, and mark it with fluorescent paper quite speedily. The number of drips which fell in a five minute period was counted. Correlation coefficients between the drip rate values and the rainfall were calculated. The paper is intended to show how information to the caver can be produced from very elementary data collection by simple statistical analysis. (Woodard-USGS)
W71-08117

PRELIMINARY RESULTS OF AN APPLICATION OF THE PROCEDURE FOR THE MEASUREMENT OF AGGRESSIVENESS OF WATER TO CALCIUM CARBONATE,
R. Stenner.
Cave Research Group of Great Britain Transactions, Vol 12, No 4, p 283-289, Dec 1970. 7 p, 6 fig, 12 ref.

Descriptors: *Underground water, *Caves, *Limestones, *Water analysis, *Water chemistry, Chemical analysis, Analytical techniques, Hydrogeology, Geology, Rainfall, Temperature, Percolation, Percolating water, Hydrographs, Groundwater movement, Temporal distribution, Surface waters, Karst.
Identifiers: *England, *Cave hydrology, Sinking streams.

The usefulness of a procedure for the measurement of aggressiveness of water to calcium carbonate was investigated by incorporating it in a more comprehensive hydrological study in G. B. Cave, Somerset, England. In a study of the solution of limestone by the main stream, the important part played by boulder ruckles was shown. Temporal changes in potential total hardness were investigated in streams of underground water and percolation water; effects of precipitation and temperature were found to be negligible except in times of highly abnormal rainstorms, in which case delayed effects were found. Variations in aggressiveness of percolation water were studied in conjunction with hydrographs, giving new information concerning the mechanism of limestone solution in the Mendip Hills of Somerset. N. I. Bazilevich.
Available from the National Technical Information Service as TT-6955086, $3.00 in paper copy, $0.95 in microfiche. Jerusalem, Israel Program for Scientific Translations, 1970. 392 p. Trans. of Geokhimiya Pochv Sodovobo Zasoleniya, Moscow, 1965.
Identifiers: *Soda ash deposits, *Geochemistry, *Sodium carbonates, Geochemistry, *Soil chemistry, Soda ash deposits, *USSR, Soda ash deposits, Siberia, Salinity, Soil analysis, Groundwater, Trees, Plants, Surface water, Translations.

This monograph embodies an attempt at an analysis and synthesis of multifarious natural processes (geological, geomorphological, climatic, formation of subsurface and surface waters, interaction between plants and soils), along with their evaluation for man's practical activities. The plans for amelioration and development of new lands in the USSR call for a full and correct understanding of the nature of soil-geochemical processes. This monograph successfully combines a profound understanding of landscape genesis and geochemistry from a detailed elucidation of soil processes, effect of the plant cover on turnover of substances in soils, with the basic principles of practical recommendations for the cultivation of soda soils.

NATURAL LEACHING OF THE HIGHLY SALT AFFECTED SOILS OF WESTERN RAJASTHAN,
Public Health Engineering Lab., Jodhpur (India); Indian Grassland and Fodder Research Inst., Jhansi (India); and Central Arid Zone Research Inst., Jodhpur (India).
I. C. Gupta, and C. T. Abichandani.
Journal of Soil and Water Conservation in India, Vol 18, Nos 1 and 2, p 62-64, Jan-June 1970. 3 p, 4 tab, 5 ref.

Descriptors: *Saline soils, *Leaching, *Irrigation practices, Soil conservation, Soil management, Irrigation, Cultivation.
Identifiers: *India.

Saline groundwaters of salinity level 4 to 10 mmhos EC/cm occur widely in Western Rajasthan, India. Some of these are used for growing salt tolerant Kharchi wheat. Two rainy seasons of 250-400 mm rainfall serve to reclaim the soil, and no crop is taken during the rainy seasons because of capillary rise during the following hot season after the saline water irrigation is over. The highly saline sandy soil profile of medium depth became salt free with precipitation of about 10 cm in the cropping season of 1964-65 and supplemental irrigation with moderate saline water did not make the soils saline; there was no accumulation of soluble or exchangeable sodium in the root zone of the soil. THE EFFECT OF HYDROPHOBIC SUBSTANCES ON WATER MOVEMENT IN SOIL DURING INFILTRATION,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Leonard F. DeBano.
Soil Science Society of America Proceedings, Vol 35, No 2, p 340-343, Mar-Apr 1971. 4 p, 4 fig, 2 tab, 17 ref.

Descriptors: *Soil water movement, *Wettability, *Unsaturated flow, *Diffusion, *Infiltration, Permeability, Soil physical properties, Wetting, Diffusivity, Organic acids, Humic acids.
Identifiers: Water-repellent soils.

The effect of hydrophobic substances on soil water movement was studied by infiltrating water horizontally and vertically into soil columns packed with wettable and water repellent soils. Horizontal infiltration was 25 times slower in water repellent soil than wettable soil. In the water repellent soil, the water content decreased 20 to 25% between the water source and the wetting front. In contrast, water content dropped 10% in the same region of the wettable soil. Diffusivities calculated for the two types of soil suggested that hydrophobic substances had the greatest effect on water movement at the lower water contents. The orientation of the columns during water entry affected the shape of the soil-water profiles in the water repellent soil, but not in the wettable soil. The diffusivities calculated from horizontal infiltration experiments were not useful for predicting soil-water profiles during vertical infiltration into either the wettable or water repellent soils. (Knapp-USGS)
W71-08087

SOIL WETTABILITY IN UTAH JUNIPER STANDS,
Forest Service, Tempe, Ariz.
David G. Scholl.
Soil Science Society of America Proceedings, Vol 35, No 2, p 344-345, Mar-Apr 1971. 2 p, 1 fig, 1 tab, 11 ref.

Descriptors: *Soil water movement, *Wettability, *Unsaturated flow, *Diffusion, *Infiltration, Permeability, Soil physical properties, Wetting, Diffusivity, Organic acids, Humic acids.
Identifiers: Water-repellent soils.

Wettability varied widely between three ground-cover zones and three soil horizons in a Utah juniper stand. Resistance to wetting in the surface soil increased from completely wettable in open areas to highly nonwettable in the litter under the juniper canopy. Resistance to wetting decreased with depth in the soil profile below the litter zone and increased with increasing organic matter. Changes in the soil moisture level also influenced the wettability of the various zones and horizons. Wettability was determined at 1/3 and 15 bars moisture tension and air-dry, with the 15-bar level showing the greatest resistance to wetting. (Knapp-USGS)

THE SOIL WATER REGIME OF AN ARID GRASSLAND COMMUNITY IN CENTRAL AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Rangelands Research Unit.
R. E. Winkworth.
Agricultural Meteorology, Vol 7, No 5, p 387-399, Oct 1970. 4 fig, 14 ref.

Descriptors: *Arid lands, Soil water, Measurement, *Precipitation (Atmospheric), Evaporation, Percolation, Soil moisture, Equipment, Runoff, Foreign countries, Drying, Climatological data, Recharge.
Identifiers: *Australia, *Grassland.

A red-earth-soil arid tussock grassland in Australia was studied for precipitation recorded and soil moisture content over a two-year period. The mate is arid, with mild winters, and hot summ Most precipitation occurs during the summ with long dry periods separating times of rain After rain, soil wetting was rapid down to about cm. Depletion of soil moisture began about weeks after precipitation, and soil moist remained low until the next rainfall. Periods available soil water ranged from 25 to 141 d Surface runoff always accompanied precipitat Soil water storage was measured by gypsum-bl conductivity. Results were affected by errors in soil and insensitivity of drying soil. 632 mm precipitation were recorded during the study which about 52 percent recharged the soil and percent was directly evaporated. Descriptors: *Sedimentation, *Reservoir silt *Sedimentation rates, Sediment transport, *S ment distribution, Bottom sediments, Clays, P cle shape, *Particle size, Sands, Silts, Watersh Mineralogy, Petrology.

The purpose of the research was to deter quantitatively the extent soil characteristics o contributing watershed influenced the rate type of sedimentation in a reservoir. The study made on fourteen reservoir - watershed comb tions in Indiana and Illinois. Particle size cha teristics of soils and sediments were shown t most significant in relating watershed cha teristics to reservoir sediment properties and ment rates. Under the conditions of the study, finer the texture of the soils of the watershed the more uniform their particle size, the gr were the sedimentation rates. Particle size ana of the sediments was also helpful in distinguis recent sediments from original bottom materia the reservoir. The amounts of mica, vermicu kaolinite and amorphous alumina found in the fraction of sediments related well to that foun the contributing soils. Very little quartz was fo in the sediment, it apparently being lost in t porting. No consistent variation was found betw the clay mineralogy of the sediments and pos within a reservoir. The clay mineralogy of the in the watersheds could not be identified as ha a direct effect on the sedimentation rates o reservoirs. (Wiersma-Purdue)

riptors: *Water chemistry, *Craters, *Lakes, canoes, *Sulfur, Sulfur compounds, Sedimentation, Chemical precipitation, Mineralogy, Geochemistry, Gases, Bottom sediments.
Identifiers: *USSR.

Chemical sedimentation is the principal process producing sulfur-bearing muds in acid crater lakes; it produces thin-bedded sediments consisting of native sulfur (25-55%), opal, alunite, and clay minerals. Iron sulfides are produced at the mud-water interface or by diagenesis of the muds. The S-34 content of the native sulfur and sulfides lie within the limits characteristic of volcanic H2S. Three main factors control sedimentation in new crater lakes: (1) rapid influx of sulfur-bearing gases from bottom fumaroles, (2) high corrosiveness of the very acid water, (3) influx of clastic and pyroclastic material. The rates of accumulation of sulfur in crater lakes are greater than those under the conditions of ordinary sedimentation by factrs greater than 100. For instance, the sulfur muds of Lake Goryacheye (Ebeko volcano), USSR, produce about 48 kg of sulfur per cum in a year. (Knapp-USGS)

ON BIOLOGICAL NITROGEN FIXATION IN NATURE, PARTICULARLY IN BLUE-GREEN ALGAE,
Carlsberg Laboratoriet, Copenhagen (Denmark).
Carsten Olsen.
Comptes Rendus des Travaux du Laboratoire Carlsberg, Vol 37, No 12, p 269-283, 1970. 6 tab, 19 ref.

Descriptors: *Nitrogen fixing bacteria, *Nitrogen fixation, *Cyanophyta, Nitrogen, Hydrogen ion concentration, Iron, Swamps, Manganese, Water quality control, Ions, Anaerobic conditions, Mud, Sands, Calcium, Symbiosis, Molybdenum, Cobalt, Lakes, Boron, Sodium, Potassium, Phosphates, Submerged plants, Legumes, Oceans, Laboratory tests.
Identifiers: Azolla, Anabaena, Azolla caroliniana, Denmark, Azolla filicoides, Zinc, Azolla pinnata, Lemna, Ferric ions, Azolla nilotica, Trichodesmium thiebautii, Sargasso Sea, Caribbean Sea.

When Azolla caroliniana, which lives in symbiosis with the blue-green alga, Anabaena azolla, is transplanted into certain types of small Danish lakes, it can spread forming a thick blanket covering the entire water surface, and can fix up to 95 kg of nitrogen per hectare in one summer. Azolla caroliniana only thrives in small lakes and other water areas where the water is usually more or less brownish, has a pH value around 6 to 7, and contains ferrous ions or complex iron-humus compounds and manganous ions in suitable concentrations. Molybdenum and cobalt are also necessary, although in very small quantities, for Azolla to attain maximum rate of fixation. The presence of ferrous ions is due to anaerobic processes in the mud layer whereby ferrous sulfide is formed. In lakes with sandy bottoms without mud and with clear, colourless water with pH values from 7 to 8 and a large calcium content (about 50 mg/l), iron occurs only as ferric ions, and in such lakes, Azolla will not develop. The plants grow chlorotic and gradually perish due to iron deficiency. Four species of Azolla are mentioned with world distribution. (Jones-Wisconsin)

CENTRARCHID FOOD HABITS IN A NEW AND OLD RESERVOIR DURING AND FOLLOWING BASS SPAWNING,
Bureau of Sport Fisheries and Wildlife, Fayetteville, Ark.
James W. Mullan, and Richard L. Applegate.
Proceedings of the 21st Annual Conference of the Southern Association of Game and Fish Commissioners, p 332-342, 1967. 5 fig, 2 tab, 11 ref.

Descriptors: *Spawning, *Fish, *Reservoirs, Fish diets, Food habits, Predation, Bass, Populations, Sunfishes.
Identifiers: *Centrarchidae, Bull Shoals Reservoir (Ark-Mo), Beaver Reservoir (Ark-Mo), New impoundments, Old impoundments, Sunfish, Bluegill.

Examinations were made of the stomach's contents of sunfish, bluegill, and largemouth, smallmouth, and spotted bass inhabiting a 15-year old reservoir and a reservoir in the process of filling. The study was conducted during and following bass spawning. The results suggested that the new basin contained an adequate supply of food to sustain the centrarchid population. The opposite was true of the old reservoir; its large fish consumed the tendipedids and cladocerans, as well as some eggs and young of bass. The newly hatched largemouth bass were dependent on left-overs of small prey. (Wilde-Wisconsin)

EVALUATION OF THE WATER BALANCE OF AN INTERCONNECTED GROUP OF LAKES AS ILLUSTRATED BY THE GREAT MASURIAN LAKES,
State Inst. of Hydrology and Meteorology, Warsaw (Poland).
Zdzislaw Mikulski.
Geographia Polonica, No 14, p 165-173, 1968. 9 p, 3 fig, 1 tab.

Descriptors: *Water balance, *Lakes, Storage capacity, Precipitation (Atmospheric), Evaporation, Runoff, Water storage, Inflow, Discharge (Water), Hydrologic data.
Identifiers: *Poland, Great Masurian Lakes, Lake storage, Water exchange, Water divide.

An attempt is made to work out the water balance of a group of interconnected lakes forming one hydrographic system. The Great Masurian Lakes located in the region of the Masurian Lake District

of northwest Poland are used as an example. Lakes of the Great Masurian Lake group located in the vicinity of the water divide show a relatively low water exchange, while the small transit lakes lying some distance from the divide have an intense water exchange. The range of fluctuations for the small lakes is vast--from several percent to well over three hundred. The annual water exchange in the northern part of the lake group amounts to 110 million cu m, so that with a lake storage capacity of over 1,000 million cu m the exchange rate is about 10%. The southern part of the lake group carries off almost five times more water than the northern part so that, with a storage capacity of approximately 1,600 million cu m, nearly one third of the water is exchanged in the course of a year. The entire group of Great Masurian Lakes exchanges annually about 40% of its waters, so that full exchange of waters theoretically takes place within about 2 1/2 years. A water layer of approximately 2.60 m thickness per year undergoes exchange. A tentative assessment of the water balance presented may provide an approach to developing water balance methods for interconnected lake groups. (Josefson-USGS)

A PROSPECT OF LAKE KARIBA,
University Coll. of Rhodesia, Salisbury.
Alan Bowmaker.
Optima, Vol 20, No 2, p 68-74, June 1970. 7 fig, 1 tab.

Descriptors: Limnology, *Ecology, *Productivity, *Biological communities, *Vegetation effects, Thermocline, Thermal stratification, Epilimnion, Hypolimnion, Environmental effects, Life cycles, Aquatic populations, Physicochemical properties, Littoral, Fish diet, Fish establishment, Fish populations, Water level fluctuations, Water hyacinth, Nutrients, Tropical regions, Habitats, Ecosystems.
Identifiers: *Lake Kariba, *Rodesia, *Plant pests, *Littoral hydrophytes.

When first created, Lake Kariba, in Rhodesia was the largest man-made lake in the world. The lake attracted a massive and famous international effort to rescue wildlife trapped by the rising waters. This effort was largely meaningless because no suitable alternative habitat was available for large mammals. Before it's creation, only cursory ecological studies were made, and this shortsight, together with a generally low level of knowledge concerning phenomena associated with the creation of lakes in tropical regions, have been reflected in the development of unforeseen problems and many errors in productivity predictions. However, unforeseen benefits have also occurred. The unseasonal flooding effects down river, caused by the lake, have endangered a considerable amount of crucial wildlife habitat. In the lake itself, thermal stratification has developed, resulting in a gradual increase in colonization space but decreases in productivity and nutrient levels after a large initial increase. Evidence indicates that nutrient levels may soon gradually increase again. A massive mat of Salvinia developed on the surface, giving rise to much anxiety and many studies on its control. Water level fluctuations have had a critical effect on productivity, since they have kept littoral hydrophytes very low and disturbed the young of some fish populations. The author feels that Salvinia may actually be beneficial since annual changes in lake volume are as much as one-third, and this would have lead to great nutrient losses if they had not been locked up in Salvinia. Introduction of Tilapia macrochir seems to have been ill-conceived, but several important species not present in the pre-impoundment era have appeared. Future projects will require much more understanding between the biologist and engineer. (Casey-Arizona)

FERN LAKE MINERAL METABOLISM PROGRAM,
Washington Univ., Seattle. Coll. of Fisheries.
Lauren R. Donaldson.
Available from the National Technical Information Service as RLO 2225-T-7-3, $3.00 in paper copy, $0.95 in microfiche. Annual Progress Report, June 16, 1970.

Descriptors: *Lakes, *Food chains, *Fishes, Algae, Plankton.
Identifiers: Mineral metabolism, *Fresh water biology, Ecology, Plankton, Fern Lake.

This past year the studies at Fern Lake have produced challenging and, in some cases, contrasting results with previous years. Fertilization was initiated in mid-June and was continued at weekly intervals for a ten-week period. The slow response of the primary producers was significant and the later dominance of a blue-green alga, Anabaena sp., had consequences that resulted in some undesirable effects, particularly to the zooplankton. Insect emergence responded favorably to the enrichment, especially in the spring of 1970, when emergence records for the ooze area were the highest ever recorded for the lake. The rainbow-steelhead trout hybrids planted in the lake this year, although showing abnormally poor growth during the fall and winter because of the low zooplankton population, produced phenomenal growth as the spring midge emerged. The growth data were almost twice that of any other year. The maximum size of the trout was 270 g, compared to previous highs of 100 g. In May of 1970, sockeye salmon were planted in the lake. This species is a plankton-feeder and will provide an opportunity to compare the production and behavioral characteristics of this fish with those of the steelhead trout.

TEMPERATURE VARIATIONS IN A WATER RESERVOIR,
A. G. Kolesnikov.
Trans. from Doklady Akademii Nauk SSSR, Vol. 92, No 1, 1953. Available from the National Technical Information Service as AD-715 028, $3.00 paper copy, $0.95 microfiche. Cold regions Research and Engineering Lab., Hanover, N.H. Translation, 1970. 7 p.

Descriptors: *Ice, *Reservoirs, *Winter, *Heat transfer, *Mathematical models, Heat budget.
Identifiers: *Ice cover, *Temperature variations, *Ground heat reserves, Temperature distribution.

The heat regime of reservoirs is usually reported on the basis of summer season investigations and there are virtually no studies of the winter heat regime of waters. The author proposes a solution to the problem of the formation of the temperature variations of water in a reservoir in the winter season during ice cover conditions. The derived equation consists of three terms. The first characterizes the stationary distribution of temperatures; the second term reflects the changes caused by the deviation of the initial distribution of water temperature at the time of formation of a continuous ice cover from a stationary value. The third term is of the greatest interest. It shows how the water temperature increases under the ice with its heating by the heat reserves contained in the ground. (Oleszkiewicz-Vanderbilt)

Identifiers: *Sahara Desert, *Nomads, *Develo ing nations, *Camels, *Ostriches.

The major resource of desert areas is an inexhaus ble supply of solar energy. While many desert r gions may be made to bloom with water applic tions, the major water supply, groundwater, is e tremely variable in quality and prospects for utilization in most desert regions are far from e couraging. The potentialities of animal science areas, particularly the Sahara Desert, where wa is unavailable for irrigation, are reviewed. Man's e fects on the deserts have been primarily destru tive, particularly through overgrazing, so th deserts of low productivity have expanded in larger deserts of virtually zero productivity. In t Sahara, goats increase productivity, but contribu further to ecological degradation. Increasing wate hole distribution should increase herbivore grazi ranges, but this is of limited practicality. The cu rent policies of various governments leading to pe manent settlement of nomads is probably ill-co ceived, since in many areas, nomadism is the on possible form of desert exploitation. Desert irrig tion projects lead to critical medical entomologic problems such as malaria, trachoma, amoeb

ary and bilharziasis. They also encourage locusts, which may be self-defeating in terms anding crop production. Possible grazing which may enhance animal production are ered, and the major possibilities appear to be mel and the ostrich. Human food habits ly seem to preclude the camel. Inadequate rity with desert ecology is resulting in a of questionable development schemes that ing only to expand the desert. Additionally, ccount must be taken of cultural peculiari- ich may also serve to defeat many projects. -Arizona)

FECT OF WATER POTENTIAL ON ARBON DIOXIDE COMPENSATION OF MAIZE AND SUNFLOWER LEAF

Univ. (Israel). Dept. of Botany.
and M. Y. Katchansky.
rnal of Botany, Vol 19, No 4, p 535-541, g, 3 tab, 18 ref.

rs: *Carbon dioxide, *Leaves, nthesis, *Dehydration, *Hydrostatic pres- es of action, Osmotic pressure, Stomata, iology, Laboratory tests, Turgidity.
: *Carbon dioxide compensation point, otential, *Relative water content.

The carbon dioxide compensation point, established at constant light and temperature values, expresses the state of balance between absorbing and releasing carbon dioxide processes in a leaf system under given conditions. Its experimental significance is in the elimination of the stomatal resistance factor. Sunflower and maize leaf segments were saturated in water, partially dried, and relative water content (RWC) was determined by weighing Tissue water potentials and osmotic potentials were determined under varying conditions. The carbon dioxide compensation points were measured, in air, by an infrared gas analyzer. With RWC decreasing to 73%, leaf compensation points gradually increased to about 300 microliters per liter. After rehydration, compensation points dropped to within range of their initial levels. The compensation point of a non-uniformly dehydrated tissue is affected mainly by its less dehydrated areas. The water potentials and osmotic potentials of both species were plotted vs. RWC on the same graph. The paired osmotic and water potential curves for each species intersected at the point of zero turgor pressure, indicating the development of small negative wall pressures at lower RWC. When leaf potentials were lowered to the same extent in mannitol solutions, the compensation points obtained, for maize and sunflower, were only 15 microliters per liter and 110 microliters per liter. Apparently the drastic increase in compensation point is due neither to stomatal closure nor to decreased water potential per se. A plot of compensation point vs. turgor pressure clearly shows a steep rise in tissue turgor with the same rise in compensation point, suggesting that in cells dehydrated in air, developing negative hydrostatic forces are a decisive factor in affecting net photosynthesis rate. SOME TECHNIQUES FOR THE MEASUREMENT OF PLANT AND SOIL WATER POTENTIALS WITH THERMOCOUPLE PSYCHROMETERS,
Montana State Univ., Bozeman. Water Resources Research Center.
Thomas J. Nimlos, Lee E. Eddleman, Charles Seeley, and James M. Jones.
Availalbe from the National Technical Information Service as PB-199 037, $3.00 in paper copy, $0.95 in microfiche. Montana Water Resources Research Center, Bozeman, Report No 14, Feb 1971. 25 p, 6 fig, 3 tab, 43 ref. OWRR Project A-039-MONT (1).

Descriptors: *Water measurement, *Soil-water-plant relationships, Plants, *Plant growth.
Identifiers: *Thermocouple psychrometers.

Studies of soil water-plant growth relationships have been hampered by the lack of an accurate, rapid method for the measurement of the tension (potential) water is under in the plant and in the soil. Recently a new method, called the thermocouple psychrometer technique has been developed whereby these measurements can be made. Thermocouple psychrometry is based on the assumption that the relative humidity near a leaf surface or in a soil mass reflects the water potential of that leaf or soil. The techniques involve measuring the relative humidity in or near a plant or soil system with ultrafine thermocouples which, by employing the Peltier effect, can be made to function as psychrometers. The measurement of soil moisture stress with the thermocouple psychrometer is very rapid and relatively easy. (Holje-Montana)

VARIATIONS IN CREOSOTEBUSH (LARREA DIVERICATA) EPIDERMIS,
Agricultural Research Service, Tucson, Ariz. Plant Science Research Div. and Arizona Agricultural Experiment Station, Tucson.
Herbert M. Hull, Samuel J. Shellhorn, and Richard E. Saunier.
Journal of the Arizona Academy of Sciences, Vol 6, No 3, p 196-205, Feb 1971. 8 fig, 2 tab, 37 ref.

Descriptors: *Xerophytes, *Ecotypes, *Plant morphology, *Epidermis, *Cuticle, Resins, Leaves, Stomata, Herbicides, Shrubs, Habitats, Electron microscopy, Absorption.
Identifiers: *Creosotebush, *Chihuahuan Desert, *Guard cells, *Trichomes.

Creosotebush is probably the most common southeastern desert shrub, characterized by leathery, dense leaves with an unusually high weight/area ratio. It is extremely drought resistant and grows in a diversity of habitats. In many areas, it has invaded former grasslands, reducing their forage production and carrying capacity. Chemical control currently appears economically unfeasible because of the excessively high herbicidal rates required. Because epidermal and cuticular structure markedly affect herbicidal absorption, an attempt was made to determine whether these structures differ in plants from 3 widely differing Chihuahuan Desert habitats. Using light and electron microscopy techniques, the structures of cuticles, epidermis cells, guard cells and mesophyll cells were examined. Cuticle and cell wall thicknesses of both leaves and stems varied more among individuals of one location than between locations. Insignificant differences in cuticle thickness between adaxial and abaxial surfaces and in epidermal cell walls indicate that differences in herbicidal sensitivities between collection sites could not be ascribed to differences in epidermal or cuticular development. The thickness of the guard cells and their subsidiary cells indicate they are of little value in transpiration supression. The distinct trichome cuticularization suggests that this structure inhibits solute absorption following a foliar spray. Probable absorption occurs via the stomata or directly through the epidermal cuticle. Since there is an inverse correlation between resin content and elevation, it appears unlikely that resins filter out harmful UV radiation. (Casey-Arizona)

THE ECOLOGY OF SMALL MAMMALS AT SARATOGA SPRING, DEATH VALLEY NATIONAL MONUMENT, CALIFORNIA,
Nevada Univ., Reno.

W. Glen Bradley, and James E. Deacon.
Partially supported by National Park Service Contract 14-10-0434-0989. Journal of the Arizona Academy of Sciences, Vol 6, No 3, p 206-215, Feb 1971. 6 fig, 4 tab, 8 ref.

Descriptors: *Mammals, *Xerophilic animals, *Ecology, *Arid lands, *Water holes, Xerophytes, California, Rodents, Mammal groupings, Wildlife, On-site investigations, Environmental effects, Surveys, Vegetation effects, Physiological ecology, Reproduction, Animal behavior, Biomass, Temperature, Precipitation, Edge effect, Ecosystems, Habitats, Springs.
Identifiers: *Death Valley, *Mojave Desert, *Species compostion.

The Saratoga Springs area of Death Valley National Monument is a low elevation marshy area with a mosaic of diverse habitats. The percentage perennial plant covers of 6 habitats were measured and described. Temperature records during the study range from below freezing in winter to above 40C in the summer. Bats were collected by shooting and mist netting, while rodents were collected in snap traps. The rodent trapping program was designed to compare relative abundance in creosote bush, rocky canyon, sand dune, salt flat and marsh habitats. Stomach and gonadal autopsies were performed to determine food habits and reproductive condition. Short accounts are given of each trapped rodent species, and their numbers relative abundance and biomass in each of the major habitats were tabulated. Excepting the salt flats, the total number of species trapped in the major habitats did not significantly differ, but numbers varied widely. Relative abundances were greatest in the more mesic sand dune and marsh habitats and could be correlated with availability of food (especially green plants), shelter and water. The edge effect created by the spatial relationships between the marsh and sand dunes probably also affects biomass. Young and subadults increase in numbers in the late spring, summer and fall, while winter populations are almost exclusively composed of adults. Stomach analyses indicate a high proportion of green vegetation in diets, and the length of most species' breeding seasons are probably proportional to it's availability. (Casey-Arizona)

Water Resources Research, Vol 7, No 2, p 311-322, Apr 1971. 12 p, 6 fig, 1 tab, 15 ref. OWRR Project B-023-ILL (2).

Descriptors: *Drainage patterns (Geologic), *Profiles, *Geomorphology, *Mathematical models, *Free energy, Entropy, Geologic control, Stochastic processes, Head loss, Energy dissipation, Energy gradient, Hydraulic gradient.
Identifiers: *Stream order, Potential energy.

Use of the analogy of entropy in thermodynamics reveals two basic laws which govern the formation of all stream systems. The first law is the law of average stream fall, which states that under the dynamic equilibrium condition the ratio of average fall between any two different order streams in the same river basin is unity. The second law is the law of least rate of energy expenditure, which states that during the evolution toward its equilibrium condition a natural stream chooses its course of flow in such a manner that the rate of potential energy expenditure per unit mass of water along this course is a minimum. This minimum value depends on the external constraints applied to the stream. The concavity of a river basin is shown to be the determinative factor in the formation of a stream system. On the basis of Horton's law and the law of average stream fall, longitudinal stream profiles can be calculated. The agreement between observed data and the theories found in this study is excellent. quarterly surveys were made of the sand-wave
of the North Sea in 1968-1969. Crest heights
a maximum of 7 m, decreasing to 2 m in the
and towards the coast. Wavelengths are from
o 500 m. Symmetrical and asymmetrical sand
s, and sand waves with superimposed megarip-
re recognized. The northern boundary to the
wave field is caused by decreasing asymmetry
tidal ellipse. This does not occur in a narrow
e extending along the coast of Texel where an
sion of the sand-wave field is found. The
wards decrease in height is mainly caused by
ase in suspension transport of sand. Megarip-
on sand waves are taken to be large scale
g of ripples on dunes seen in flumes. The
ripples represent perturbation of bed-load
port rate and the sand waves perturbation of
nded load transport rate. Thus the northwards
ce of megaripples on sand waves, decrease in
size, decrease in height and increase in
nsion transport, fit in a coherent dynamical
nation of the characteristics of the sand-wave

ge instrumented tripod was used during a
of relatively strong ebb current in Puget
, to measure simultaneously the currents
1.5 m of the sea bed and the changing ripple configuration of a sandy bottom. Measurement of the heights and migration rates of the ripples on time-lapse stereo photographs made it possible to calculate the amount of sediment moved. From the measured velocity profiles, the shear velocity and the fluid power expended on the bed were determined. These measurements of mass transport are compared with the values predicted by several existing bedload transport theories. Einstein's and Yalin's equations predict values with the appropriate trend of the curve of mass transport vs. shear velocity, but their values are too large, because of a difference in the boundary shear stress measurement used in the comparison. Bagnold relates immersed weight of transported sediment to fluid power by a proportionality coefficient, K, which reaches a constant maximum value for any system. Present measurements indicate that K increased exponentially with the growth of ripples, which in turn were related to the flow conditions. When compared with flume data, the mass transport of sediment was adequately predicted. It appears that K does not reach a constant value in most marine environments but is related to the sediment characteristics, the shear stress, and the turbulence of the flow. (Knapp-USGS)

EROSION OF UTTAR PRADESH SOILS BY WATER AND ITS RELATION TO SOIL PROPERTIES,
Allahabad Univ. (India). Dept. of Chemistry.
Anupam Varma, and S. K. De.
Journal of Soil and Water Conservation in India, Vol 18, Nos 1 and 2, p 76-82, Jan-June 1970. 7 p, 2 tab, 17 ref.

Descriptors: *Soil erosin, *Soil physical properties, *Soil chemical properties, Topography, Slopes, Laboratory tests, Soil texture, Soil chemistry, Leaching, Soil conservation.
Identifiers: *India, Uttar Pradesh (India).

Observations made in the laboratory on erosion of some Uttar Pradesh soils were correlated with soil properties. The extent of erosion by water depends not only on the time of contact of the soil by water but also on the slope percentage and physico-chemical properties of soils. Further, soils from different climatic regions behave differently so far as the extent of erosin is concerned, although they may be of the same texture. With the doubling of slope percentage, the extent of erosion doubled or more than doubled. The erosion rate appeared to be correlated with the time and the amount of soil left after erosion. The rate of erosion is directly proportional to the ionic concentration of the soil. (Knapp-USGS)

AN INFRA-RED STUDY OF CLAY MINERALS. 1. THE IDENTIFICATION OF MONTMORILLONITE-TYPE CLAYS IN MARINE SEDIMENTS,
Liverpool Univ. (England). Dept. of Oceanography.
R. Chester, and H. Elderfield.
Chemical Geology, Vol 7, No 2, p 97-105, Mar 1971. 9 p, 1 fig, 3 tab, 16 ref.

Descriptors: *Clay minerals, *Analytical techniques, *Infrared radiation, Expansive clays, Water chemistry, Ion exchange, Mineralogy, Spectrometers, Spectroscopy, Sediments, Bottom sediments, Clays.
Identifiers: Infrared spectroscopy.

The infrared spectra which result from reacting fifteen organic materials (including monohydric and polyhydric alcohols, hydrocarbons amines and azo dyes) with samples of the clay minerals illite, chlorite, kaolinite and montmorillonite were determined. A complex is formed between 2,2-dipyridyl and montmorillonite. The complex is specific to montmorillonite, and replaces water molecules in inter-sheet positions in the clay structure. This complex is made the basis of an infrared technique which may be used to identify expanding lattice clays in multi-clay samples. The technique may be applied to marine sediments, and is described in detail. (Knapp-USGS)

POSSIBILITY OF PREDICTING WATER TURBIDITY AS ILLUSTRATED BY THE OKA RIVER BASIN (RUSSIAN: O VOZMOZHNOSTI PREDSKAZANIYA MUTNOSTI VODY NA PRIMERE REK BASSEYNA OKI),
I. V. Starostina.
Meteorologiya i Gidrologiya, No 12, p 73-79, Dec 1970. 7 p, 3 fig, 4 ref.

Descriptors: *Runoff forecasting, *Turbidity, *Sediment transport, *Sediment discharge, *Suspended load, Snowmelt, Seasonal, Snow cover, Watersheds (Basins), Channel erosion, Air temperature, Precipitation (Atmospheric), Erosion, Foreign research.
Identifiers: *USSR, Oka River, Kaluga Oblast, Ice crust, Slope erosion.

Because of its typical river sediment formation and regime the Oka River basin near Kaluga was studied with respect to methodology applications for predicting water turbidity. Data from observations of suspended sediments for five discharge sites on rivers of the forest and forest-steppe zone were used. The average long-term turbidity value varied between 100 and 1,500 g/cu m; variability was measured by variation coefficients of 0.35-0.70. Maximum turbidity, formed by melt waters, preceded maximum water discharge at sites of the forest zone by 3-10 days and at sites in the forest-steppe zone by 1-3 days. Predictions of daily turbidity of the Oka River at Kaluga can be made for a period of 5-12 days, beginning from the first day when snowmelt is vigorous and from the 7th to 8th day when snowmelt is slow, provided turbidity is above 100 g/cu m. Best results in predicting turbidity are obtained for spring periods with a vigorous snow thaw covering the entire basin. Turbidity of two- and three-peak high waters is more difficult to predict. Turbidity in years during which a basin is more than 80% covered by ice or has no ice crust at all is impossible to predict. (Josefson-USGS)

MORPHOLOGICAL SLOPE EVOLUTION BY LINEAR AND SURFACE DEGRADATION,
Wroclaw Univ. (Poland). Inst. of Geography.
Alfred Jahn.
Geographia Polonica, No 14, p 9-21, 1968. 13 p, 7 fig, 20 ref.

Descriptors: *Degradation (Stream), *Geomorphology, *Slopes, *Erosion, *Rocks, Glaciation, Weathering, Gully erosion, Quaternary period, Geologic time, Tertiary period, Petrography, Orography.
Identifiers: *Poland, Carpathian Mountains, Sudeten Mountains, Slope profile, Linear erosion, Surface degradation.

The slope is treated as a surface which undergoes degradation due to denuding agents and the erosive

incision of water channels. Erosive decrements in rock mass may be calculated by comparing the slope surface as it is today with visible forms deviating in plus values (Klippen under conditions of surface degradation) or in minus values (dissection where linear degradation has taken place). Examples cited from the Sudeten and the Carpathians where slopes were treated in their totality show that the removal of rock mass is caused primarily by the erosive action of water. It is believed that the action of water running down a slope in small rills may gradually induce (especially in soft rock types) a complete modification of the slope, including its recession. Surface degradation effects all types of rocks without much variety in its way of acting. Often the susceptibility of rock to erosive dissection determines the ultimate evolution of a slope. The morphological difference between a slope of soft rocks and massive rocks resolves itself into a difference in resistance of the rock material to linear erosion, with weathering as an intermediate process. This explains the difference in slope forms between the Carpathians and the Sudeten, or the striking contrast apparent in the slopes of Sleza and Radunia, the two mountains close to each other in the Sudeten forefield. Erosive dissection of rock material is an important process in slope degradation and recession, probably more important than surface degradation. (Josefson-USGS)

THE DYNAMICS OF SEDIMENTARY ENVIRONMENTS IN THE LIGHT OF HISTOGRAM TYPES OF GRAIN ABRASION,
Adam Mickiewicz Univ., Poznan (Poland). Inst. of Geography.
Ludwika Krygowska, and Bogumil Krygowski.
Geographia Polonica, No 14, p 87-92, 1968. 6 p, 3 fig, 1 tab, 12 ref.

Descriptors: *Deposition (Sediments), *Abrasion, *Sediments, *Histograms, Sieve analysis, Particle size, Beaches, Dunes, Sands, Weathering, Granites, Till, Rivers, Gravels.
Identifiers: *Poland, Grain abrasion, Sand grains.

Numerous attempts have been made to determine the dynamics of sedimentary environments from studies of the deposits left by them. These attempts have mostly been based on the structure of the deposit, its particle-size composition and, less often, its grain abrasion. By applying mechanical graniformametry, a relatively rapid determination of grain abrasion from a large number of samples is possible. Conclusions derived in the present work are based on an examination of more than 1,500 samples collected from 8 different sedimentary environments and on several thousand analyses (abrasion tests) by means of their graniformameter. The source material confirms the view that a sedimentary environment of deposition and its dynamics are characterized by more than one parameter. The parameters considered here are the coefficient of grain abrasion, the coefficient of abrasion irregularity and the histogram type of grain abrasion. (Josefson-USGS)
W71-08108

THE EASTERN SIBERIAN KARST,
Wroclaw Univ. (Poland). Inst. of Geography.
Marian Pulina.
Geographia Polonica, No 14, p 109-117, 1968. 9 p, 6 fig, 1 tab, 19 ref.

Descriptors: *Karst, *Chemical degradation, *Erosion, *Topography, Orography, Watersheds (Basins), Caves, Meteorological data, Hydrogeology, Salts.
Identifiers: *Eastern Siberia, Siberian Platform, Irkutsk Amphitheater, Karst rocks, Karst hydrography, Karst regionalization, Karst relief.

To study chemical karst denudation, karst phenomena in the Siberian platform and in the mountain regions of the Eastern Sayan Ridge and Chamar-Daban on the Baykal shore, constituting part of the 'Irkutsk Amphitheater,' are examined. The areas covered by soluble rocks occupy some 30% of the surface of the Irkutsk Amphitheater, equivalent to a total of more than 300,000 sq km. The overall chemical denudation for karsted and nonkarsted areas comprising the Angara and the Baykal drainage basins totals more than 3 cu m/sq km/yr. With regard to mineral material carried by the Angara, chemical degradation accounts for 10-20%. Results obtained show that the best developed karst relief of the Siberian Platform lies in the Irkutsk Amphitheater. In the mountain areas of the Irkutsk Amphitheater the evolution of karst relief is insignificant, with older karst forms surviving merely in relict form. The effect of present day chemical denudation in Eastern Siberia fluctuates between 2 and 60 cu m/sq km/yr, representing, at most, one half of the values for European karst regions in a temperate climate at similar geographical latitudes. The new large storage basin for the Bratsk hydroelectric plant in the Angara valley, by raising the water level 60 m within the karst regions, has revived old forms of surface karst and caverns. The chemical infiltration of active transitory waters of the Angara is leading to the transformation of older and the creation of new karst mesoforms. (Josefson-USGS)

ERODIBILITY OF SLOPES (PHASE I),
California State Div. of Highways. Materials and Research Dept.
Travis Smith.
Available from the National Technical Information Service as PB-196 526, $3.00 in paper copy, $0.95 in microfiche. Interim Report No M and R 632101, July 1970.

Descriptors: *Highways, *Erosion control, *Soil tests, Slopes, Test procedures, California, Sampling.

The results of a literature search and the results of a preliminary laboratory testing program . are presented. Based upon past research by the U.S. Department of Agriculture and other agencies, it now appears that erosion potential of a given soil can be evaluated by appropriate laboratory tests, the two most promising being the 'Dispersion ratio' and the 'surface aggregation ratio'. Preliminary test results utilizing both tests were reasonably consistent. The use of larger samples and a lesser degree of sample disturbance are expected to improve reproducibility.

ious gaseous sulfur compounds constitute a of volcanic gases in all stages of their evolu-, beginning with eruption of melted lava and in-ing post-volcanic solfatara activity. Under sur- and near-surface conditions, native sulfur rates from volcanic sulfurous gases. More or substantial sulfur deposits are widely dis-ted in regions of active volcanism. In Central South America, Indonesia, Japan, and some r countries, sulfur of volcanic origin is ob-ed in commercial quantities. In the U.S.S.R., r deposits and sulfur-shows of volcanic origin found in many places of the Kamchatka penin- and the Kuril Islands. Processes of sulfur ox-on to sulfuric acid with the participation of obacillus thiooxidans occurs in the near-surface s of sulfide-sulfur ores of the impregnation-asomatic sulfur deposits in the Kuril-Kamchat-egion. Sulfide minerals decompose in a sul-acid medium formed in the oxidation zone; ltaneously, iron is carried out by acid waters redeposited from solutions along the periphe-of the oxidation zones. In the oxidation ess, new formation of secondary sulfate rals takes place, while migration of silica and redeposition is observed in several deposits. ite, silicon minerals and rutile are the stable rals in the sulfuric-acid weathering zone. refore, formation of porous quartz-opal rocks is nd result of oxidation and leaching of sulfide-r ores. REDEFINITION OF SALINITY,
Scientific Committee on Oceanic Research; and International Council for the Exploration of the Sea, Hydrography Committee; and International Association of the Physical Sciences of the Ocean.
Warren S. Wooster, Arthur J. Lee, and Gunter Dietrich.
Journal of Marine Research, Vol 27, No 3, p 358-360, 1969. 6 ref.

Descriptors: *Salinity, *Measurement, *Water analysis, Sea water, Analysis, Electrical conductance, Conducitivity, Analytical techniques, Oceanography.
Identifiers: UNESCO, International Oceanographic Tables, Salinity redefinition.

According to the old definition, salinity was expressed in g of dissolved solid material per kg of sea water following substitution of bromine by an equivalent quantity of chlorine, conversion of carbonates to oxides, and destruction of organic matter. This complicated procedure was usually replaced by a questionable empirical formula: S 0.1% — 0.030 .. 1.8050 Cl 0.1%. With the introduction of electrical conductivity analyses, the salinity was defined as 1.80655 Cl 0.1% and the chlorinity was converted to salinity on the basis of the polynomial computed by using least squares. This formula permitted construction of the International Oceanographic Tables, including conductivity ratios from 0.85000 to 1.17999 and the range of salinity from 29,196 to 42,168 0.1%. Oceanographers are encouraged to use the new definition of salinity. (Wilde-Wisconsin)

Descriptors: *Primary productivity, *Coasts, *Phytoplankton, *Estuaries, *Standing crop, Seasonal, Diatoms, Dinoflagellates, Chlorophyll, Photosynthesis, Temperature, Sampling, Salinity, Dissolved oxygen, Nutrients, Carbon radioisotopes, Phosphates, Silicates, Solar radiation, Depth, Thermocline, Nitrates, Light intensity, Eutrophication, Marine algae, Sea water, New York.
Identifiers: *Coastal waters, *Southern Long Island, Skeletonema costatum, Thalassiosira, Chaetoceros, Rhizosolenia alata, Peridinium depressum, Peridinium pallidum, Ceratium massilense, Ceratium furca, Ceratium tripos, Ceratium macroceros, Noctiluca miliaris, Gymnodinium splendens, Exuviella marina, Eutreptia, Nitzschia seriata, Thalassionema nitzschoides, Asterionella japonica, Chlorophyll-a.

In conservation of coastal marine resources, maintenance of natural primary productivity of coastal waters is significant. During 1966, monthly determinations of phytoplankton productivity of tidal esturaries and coastal waters of southern Long Island were made. Sustained blooms of green flagellates and dinoflagellates were found during spring and summer in estuarine waters; in coastal areas alternating abundances of diatoms and dinoflagellates dominated the standing crop during late winter, early fall, and summer. The chlorophyll-a distribution in estuaries exhibited two patterns, lasting about six months each, with concentration ranging from 1.0 to 27.6 mg/cu m. In the coastal areas its distribution showed a reversed pattern with range from 1.45 to 10.15 mg/cu m. Vertical distribution of chlorophyll-a within the coastal region euphotic zone showed similar patterns both nearshore and offshore. Mean photosynthesis rates per unit of chlorophyll-a varied from 3.1 to 3.5 mg carbon/mg chlorophyll-a/hour; at light saturation, ratio varied with water temperature and species composition. Mean primary productivity values were 0.35, 0.22, 0.16 g carbon/cu m per day for estuaries, nearshore, and offshore areas, respectively, decreasing seaward. (Jones-Wisconsin)

HIGH MOLECULAR WEIGHT ALGAL SUBSTANCES IN THE SEA,
Naval Undersea Research and Development Center, Pasadena, Calif.
J. W. Hoyt.
Marine Biology, Vol 7, No 2, p 93-99, 1970. 3 fig, 3 tab, 19 ref.

Descriptors: *Molecular structures, *Algae, *Fluid friction, *Littoral, Plant growth substances, Phytoplankton, Fluid mechanics, Exudation, Oceans, Chlorophyta, Phaeophyta, Rhodophyta, Marine bacteria.
Identifiers: *High molecular weight compounds, *Molecular size, *Algal exudates, Extracellular material, Turbulent friction, Seaweed, Porphyridium cruentum, Porphyra, Gigartina.

Turbulent-flow measurements in a special rheometer revealed that commercial seaweed extracts and certain members of phytoplankton have extracellular materials of large molecules with weights exceeding 50,000. Extracts from a variety of littoral algae, particularly of Porphyra and Gigartina genera, have changed the turbulent friction thereby indicating the presence of high-polymer substances. Porphyridium cruentum produced friction reduction as high as 60%. Results suggest that algal exudates are the source of high molecular compounds in the sea. (Wilde-Wisconsin)

HYDROGRAPHY AND HOLOCENE SEDIMENTATION OF THE MERRIMACK RIVER ESTUARY, MASSACHUSETTS,
Massachusetts Univ., Amherst. Dept. of Geology.

Allan D. Hartwell.
California University Department of Geology Contribution No 5-CRG, 1970. 166 p, 62 fig, 32 ref. ONR Contract Nonr N00014-67-A-0230-0001 Task Order NR388-084.

Descriptors: *Hydrography, *Sedimentation, *Estuaries, *Massachusetts, Tidal effects, Streamflow, Runoff, Sediment distribution, Particle size, Water circulation, Sediment transport, Currents (Water), Salinity, Alluvial channels, Deltas, Flooding.
Identifiers: *Merrimack River estuary (Mass).

The Merrimack River estuary is situated on glaciated terrain along the coast of northeastern Massachusetts. When the tide floods during periods of normal and high runoffs, a sharp, slightly tilted boundary develops between the intruding salt-water mass and the overriding fresh water. The salt water from the ocean is deflected to north. The fresh water ponds up on the south side, where a significant amount of the suspended sediment and pollutant load carried by the river is deposited. When discharge drops below approximately 3000 cfs, the stratification disappears and the estuary becomes partially mixed. Maximum ebb-current velocities, which are frequently twice as strong as flood-current velocities, are concentrated in the surface portion, whereas maximum flood-current velocities occur near the river bottom. The distribution of bottom sediments is closely related to the hydraulic circulation pattern, tidal current velocities, bottom topography, and sediment source areas. (Woodard-USGS)

Descriptors: *Marine plants, *Beaches, *Sands, *Ocean waves, *Environmental effects, Drainage, Oxygen, Organic matter, Microorganisms, Pumping, Chlorophyll, Diatoms, Depth, Algae, Sulfides, Tidal effects, Bacteria, Marine microorganisms, Energy, Littoral.
Identifiers: *Epipsammic flora, *Sublittoral, Scotland, Beach level, Firemore (Scotland), Rhodamine B, Interstitial water movement, Sand mixing.

Beach level alterations, sand mixing by wave action, water percolation due to pressure changes associated with waves, and water drainage into beaches were studied on an exposed beach in Scotland. Results suggests that drainage is the dominant effect on the littoral zone in supplying oxygen and organic matter to the interstitial microflora. Sublittorally, pumping due to wave action may be important. On exposed beaches, effect of wave action in mixing and redistributing surface layer of sand will determine particle size and inhibit formation of algal surface mats and unattached debris accumulation. These effects are insufficient to explain the different depth distributions of chlorophyll, the oxygen profile differences, and the sulfide accumulations below 5 to 10 cm in sand offshore but not at low water mark. Main energy flow into interstitial ecosystem is by uptake of soluble organic matter by bacteria attached to sand grains. Decreased rate of sand mixing offshore and increased water movement at low water can explain differences in chlorophyll profiles in littoral and sublittoral areas but do not reveal the mechanisms by which diatoms below the sand surface at low water mark can survive for long periods in the dark. Journal of the Marine Biological Association of the United Kingdom, Vol 51, No 1, p 137-157, Feb 1971. 21 p, 12 fig, 14 tab, 19 ref.

Descriptors: *Estuaries, *Nutrients, *Water chemistry, Water balance, Tides, Mixing, Density stratification, Ecology, Saline water intrusion.
Identifiers: Ythan Estuary (Scotland).

The Ythan estuary, a short shallow estuary in northeastern Scotland, was surveyed over a 2-year period to determine environmental characteristics and distribution of nutrients and organic carbon. The tide is the dominant environmental factor. Ratio of tidal prism volume to fresh water volume at mean high water is about 20:1. Flow ratios indicate that the estuary is well mixed. Flushing time for mean tides was calculated as 1.15 tidal periods. The horizontal salinity gradient varied seasonally and with tidal amplitude. Seasonal variations were related to rainfall and evaporation. Channel salinities near the mouth ranged from 1.7 parts per 1000 at low tide in spring to 34.2 parts per thousand at high tide in summer. The horizontal gradient in nutrient concentration was related to tidal incursion. Freshwater levels of inorganic phosphate were slightly higher than marine concentrations; amounts of nitrate and silicate in the fresh water were about an order of magnitude greater than in marine water. Fresh water supplies about 70% of the nitrate and 80% of the silicate which flows into the estuary; marine water contributes about 70% of the phosphate. Most of the organic matter entering the estuary with fresh water was detritus of terrestrial origin. The marine contribution of particulate carbon exceeded that of fresh water by an order of magnitude. (Knapp-USGS)

For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402, Price $0.45. Office of Saline Water Research and Development Progress Report No 630, Dec 1970. 35 p, 8 ref. OSW Contract 14-01-0001-2246.

Descriptors: Reverse Osmosis, *Membranes, *Permselective membranes, *Semipermeable membranes, *Desalination, Saline water, Separation techniques, Membrane processes, Osmosis, *Membrane processes.
Identifiers: Ethyl cellulose, Cellulose ether esters, Cellulosic membranes, Solubility parameters.

The formation of asymmetric membranes from ethyl cellulose has been investigated, and the potential for their use in reverse osmosis evaluated. Previous investigators have shown that this cellulose derivative has water permeability and salt permeability properties which indicate that it should form highly rejecting membranes. In addition, ethyl cellulose polymers have hydrolytic stability and mechanical resistance properties which compare favorably to cellulose acetate polymers. The first phase of this program examined the effects that the degree of substitution has on the physical and mechanical properties. It was demonstrated that the water content of the polymer films increased as the degree of substitution decreased and fewer hydroxyl groups of the glucose rings were etherified. Similar correlations were established for the relationships between D.S. of the polymer and initial moduli and ultimate tensile strength of the films derived from the polymer. A systematic approach to preparing asymmetric membranes has been employed, based on a detailed understanding of the solution properties of ethyl cellulose. The raw data were taken from the literature, manufacturers bulletins, and augmented by laboratory experiments. Solubility parameters were used to devise a hypothesis for solvent combination requirements which would yield ethyl cellulose solutions capable of forming asymmetric membranes. DEVELOPMENT OF IMPROVED CELLULOSE ACETATE MEMBRANES,
Hercules, Inc., Cumberland, Md. Allegany Ballistics Lab.
Mark E. Cohen, Michael A. Grable, and Billy M. Riggleman.
For sale be the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402, Price $1.00. Office of Saline Water Research and Development Progress Report No 608, Sept 1970. 94 p, 26 fig, 29 tab. OSW Contract 14-30-2527.

Descriptors: *Desalination, *Membranes, Reverse osmosis, *Membrane processes, Osmosis.
Identifiers: Hollow fibers, Tubules, Skinned membranes, *Composite membranes, Cellulose esters, Ultrathin membranes, Membrane casting formulations.

The objectives of this program were to develop improved hollow-fiber membranes for reverse osmosis and to evaluate the best membranes developed in a bench-scale module. Both asymmetric and composite membranes were investigated. These studies produced a high performance asymmetric hollow-fiber membrane which operated successfully in modules with capacities up to 175 gpd. Substantial progress was also made toward preparing high-flux composite membranes. Composite membranes were prepared by directly coating cellulose nitrate shock gels with dilute chloroform solutions of cellulose triacetate and mixtures of cellulose triacetate and high-molecular-weight polyethylene glycols. The cellulose nitrate shock gels show outstanding promise as composite membrane substrates, being both highly porous and finely porous as well as exhibiting good mechanical properties. These composite membranes, in flat-sheet form, gave water flux rates approaching 20 gfd at a 90% sodium chloride rejection level, and 11 gfd at a 97% sodium chloride rejection level, when tested with a 0.5% sodium chloride feed brine at 1500 psi. Their performance in hollow fibers was lower, however, because of the much lower permeability of the hollow-fiber shock-gelled substrates. A 0.13 gfd flux rate and a 99.0% sodium chloride rejection were obtained in a composite hollow-fiber membrane with a 0.5% sodium chloride feed brine at 600 psi. Improvements in the fabrication of the cellulose nitrate shock-gelled hollow-fiber substrates should allow preparation of very high-flux composite hollow-fiber membranes. 3B. Water Yield Improvement

A METHOD FOR CHARACTERIZING THE RUNOFF POTENTIAL OF RAINFALL IN WATER HARVESTING SCHEMES,
Hebrew Univ., Rehovoth. Faculty of Agriculture.
E. Rawitz, and D. Hillel.
Supported in part by US Dept of Agriculture, Soil and Water Conservation Div. Water Resources Research, Vol 7, No 2, p 401-405, Apr 1971. 5 p, 4 fig, 2 tab, 8 ref.

Descriptors: *Rainfall-runoff relationships, *Arid lands, *Runoff forecasting, *Water yield, Water supply, Water balance, Data collections, Infiltration, Rainfall disposition, Rainfall intensity, Storm runoff.
Identifiers: *Runoff potential, *Israel.

A method is presented for evaluating the runoff-producing potential of rainfall patterns and for estimating the amount of water hypothetically obtainable from water harvesting areas of given average infiltration rates. Data obtained from the arid zone of Israel indicate that the distribution of rainfall amounts in relation to rainfall intensities is skewed toward the low intensities and that a few large storms generally account for most of the total rainfall and runoff producing potential. Scaling of rainfall intensity versus relative rainfall amount shows that seasons with widely different total rainfalls nevertheless have similar relative distribution patterns. This fact suggests the possibility of finding a function that can adequately characterize the relative intensity distribution pattern of a region and can be used to predict runoff potential in relation to seasonal rainfall probabilities. CLOUD-SEEDING EXPERIMENT, TASMANIA, 22 DECEMBER 1966 TO 26 FEBRUARY 1969,
Commonwealth Scientific and Industrial Research Organization, Sydney (Australia). Div. of Radiophysics.
E. J. Smith, and E. E. Adderley.
Available from the National Technical Information Service as N70-43097, $3.00 in paper copy, $0.95 in microfiche. Commonwealth Scientific and Industrial Research Organization (CSIRO) 3rd Progress Report, Dec 1969. 102 p, 13 fig, 14 tab, 3 append.

Descriptors: *Cloud seeding, *Rainfall, *Silver iodide, *Artificial precipitation, Aircraft, Reviews, Meteorological data, Clouds, Winds, Air masses, Atmosphere, Weather.
Identifiers: *Australia (Tasmania).

A cloud seeding experiment conducted in Tasmania, Australia from December 1966 to February 1969 is described. Its main purposes were to determine the amount by which seeding clouds with silver iodide smoke released from an aircraft can increase precipitation in a hydroelectric catchment area, the circumstances in which the increases can be obtained and the duration of the effects. The seeding operation was carried out in alternate years only. On days when clouds are suitable for seeding, they are seeded in seeded periods but observed and not seeded in unseeded periods. Thus rainfall may be compared on two similar sets of suitable days, on one set of which clouds were seeded and the other not. No statistical bias is involved. Similarly, rainfall on seeded days of a given type may be compared with rain on unseeded days of otherwise similar type. Rainfall totals and ratios on seeded and suitable days, together with subdivisions by cloud type and air mass are tabulated. In 1968 seeding was successful in frontal and cyclonic air masses and with stratiform and indeterminate clouds in the west and cumuliform clouds in the east. (Woodard-USGS)

RECLAMATION OF SALINE-SODIC SOILS IN THE UPPER COLORADO RIVER BASIN,
Colorado State Univ., Experiment Station, Grand Junction.
C. W. Robinson.
Colorado State University Experiment Station, Bulletin 535S, Mar 1968. 19 p, 11 fig, 1 tab.

Descriptors: *Reclamation, *Crop production, *Soil-water-plant relationships, *Drainage practices, *Irrigation practices, Salts, Alkaline soils, Saline soils, Saline water, Colorado, Electrical conductance, Gravels, Aquifers, Sodium compounds, Calcium compounds, Magnesium compounds, Chlorides, Sulfides, Leaching, Pumping, Irrigation efficiency, Water table, Wheat, Corn (Field), Rehabilitation, Treatment, Soil amendments, Crop response.

Below-average yields in arid and semi-arid lands may be due to accumulation of soluble salts and akaline soils. Sodic soils commonly become abandoned. The irrigated Grand Valley of western Colorado has 20,000 acres of below-average crop production. The Mancos Shale, parent material for soil, contains highly saline groundwater--electrical conductivity of 9.0 mmhos/cm in the shallow gravel aquifer, and more than 100 mmhos/cm in saturated soil pastes. Sodium, calcium, and magnesium chlorides and sulfates accumulate and may be leached to reclaim soils by additional irrigation. Soil amendments and salt tolerance are discussed. Pump drainage lowers the water table to reclaim soils efficiently. Pumping at 250 to 300 gallons per minute after 15 months lowered the water table about 2 feet in 150 to 200 acres with significant wheat and corn production improvement. Over irrigation and pump drainage proved a successful rehabilitation method for saline-sodic soils in the Upper Colorado River Basin. A table shows effects of leaching treatments on soluble salt content and exchangeable sodium percentages of soil. Ele figures show general topography of study area, t ical fields of reclaimed and abandoned la leaching effects, conductivities, yields and c response. (Popkin-Arizona)

griculture is the largest consumptive user of water this country, but irrigation is generally planned th little knowledge of the need of the crop for ter. A method is described for determining the oisture status of corn and soybeams and it apars that it may be constructed more economilly than previously thought. The technique is sed on pressure that it applied to individual aves. It was studied in conjunction with measureents of photosynthesis which showed that it is ssible to predict how photosynthesis is affected drought with measurements using the instruent. In corn and soybeans, photosynthesis was afcted when water was still relatively available to crop and well before any signs of drought were ible. Therefore it is important to be able to mea-re the moisture status of corn and soybeans for aximum yield. Chloroplasts were also isolated m leaves which had been desiccated to varying grees in order to determine whether drought afcts photosynthetic activity at the subcellular el. Inhibition of activity was found in both sunwer and pea chloroplasts as the leaves became siccated. The inhibition occurred at desiccation els which are common during drought.

ntifiers: *Northeastern Brazil, *Sisal, *Human logy.

e sertao of northeastern Brazil is a semiarid rn scrub region where crop and cattle produc- prevail. In drought years, agricultural produc- is minimal and large numbers of people must rate out of the region. In most years, until ently, nutritional levels were reasonable quate for the peasant laborer population, which w beans, squash and manioc on their small landdings. Since 1951, sisal has become an increasy important crop, so that in the last decade an rwhelming percentage of small landholders had un growing it. Sisal is a highly drought resistant t whose broad leaf contains a cellulose core ch may be twisted into twine and rope. ough easily cultivated, the plant requires high uts of labor for weeding, without which a field omes choked and unreclaimable. Between 1951 962, world market prices were extremely high the majority of peasants abandoned food crops for sisal. This resulted in a precipitous drop in food production and the region became a net food importer. A small group of prosperous entrepeneurs developed, who were involved in sisal processing or food shops. Since 1962, sisal prices have plummeted and small growers have had to abandon their fields and work for processors. On-site investigations have shown that for the majority, nutritional levels have decreased. Progress has come to only a few, while most people have become more impoverished. This illustrates the necessity for an ecological approach in all agricultural economic planning. (Casey-Arizona)

ONION SEED PRODUCTION IN YUMA COUNTY,
Agricultural Research Service, Tucson, Ariz.
Don R. Howell, and G. D. Waller.
Progressive Agriculture in Arizona, Vol 23, No 1, p 10-11, 16, Jan-Feb 1971. 3 fig.

Descriptors: *Onions, *Seeds, *Crop production, *Limiting factors, *Crop response, Arizona, California, Risks, Cultivation, Fertilization, Nitrogen, Phosphate, Irrigation practices, Pretreatment (Water), Plant growth regulators, Herbicides, Weed control, Pest control, Profit, Economic feasibility, Planting management, Field crops.
Identifiers: *Seed production, *Crop failures, *Pollinators, Honey-bee colonies, Yuma County (Ariz).

'Short-day' onion seed production is most successful in areas with warm, sunny, squall-free days such as prevail at Yuma, Arizona, though even here seeds are high-risk crops. Under proper conditions, however, seed production in Yuma County can be a profitable operation. Seed cultivation methods are discussed in this investigation of crop failures in Yuma County in 1969 and 1970. Side dressing and water-run fertilization by nitrogen and phosphate follow planting, though preplanting fertilization is practiced. Pre-irrigation occurs during early fall, and winter irrigation in seed-to-seed fields is withheld to 'shock' seeds to bulb. Some irrigation of bulb-to-seed fields resumes in December and January. A spring irrigation delay increases growing rate. Herbicides are used to control weeds and pests. Honey bee colonies serve as pollinators. Specially adapted combines facilitate harvesting. Plant disease control during cool-wet years needs further study, as does more adequate pollination because of the preference for honey bees of desert plants having the same blooming period as the onion plants. WHEAT IRRIGATION AFFECTS FLOUR YIELD AND QUALITY,
Arizona Univ., Tucson; and Arizona Agricultural Experiment Station, Tucson.
A. D. Day.
Progressive Agriculture in Arizona, Vol 23, No 1, p 3, 16, Jan-Feb 1971. 1 tab.

Descriptors: *Wheat, *Irrigation effects, *Gains (Crops), *Feeds, *Crop production, Arizona, Proteins, Viscosity, Limiting factors, Crop response, Soil moisture, Moisture stress, Moisture uptake, Mixing, Field crops.
Identifiers: *Flour production, *Flour quality, *Milling, *Mixing curve peak, *Mixing curve area, Baking, Gluten.

Wheat production, for grain used for milling or livestock feed, has increased in Arizona. Yield, protein, alkaline water retention capacity, viscosity, mixing curve peak and area were investigated to evaluate irrigation effects on milling and baking quality of flour. Large yield reductions occurred when water was withheld at jointing. Highest protein was produced when plants were water stressed. Highest alkaline water retention capacity was found when moisture was withheld at jointing. High flour viscosity and stronger gluten occurred when soil moisture was withheld. Water stress at dough stage required longer time to reach flour mixing curve peak. Moisture stress decreased mixing curve area significantly. Flour protein content variations produced proportional viscosity and mixing curve area changes. (Popkin-Arizona)

WATER RESOURCES AND IRRIGATION DEVELOPMENT IN THE MIDDLE EAST,
Keble Coll., Oxford (England). Dept. of Geography.
C. G. Smith.
Geography, Vol 55, No 249, p 407-425, Nov 1970. 8 fig, 1 tab, 21 ref.

Descriptors: *Water resources, *Water resource development, *Arid lands, *Regional analysis, *Irrigation programs, Dry farming, Geographical regions, Social aspects, Political aspects, Economic feasibility, Temperature, Seasonal, Rainfall, River basins, River flow, Soil moisture, Precipitation (Atmospheric), Competing uses.
Identifiers: *Middle East, *Mediterranean climates, *Potential evapotranspiration.

The Middle East is arbitrarily defined as Egypt and southwest Asia, excluding Afghanistan. Two types of climate occur in the area, arid and semiarid, which are undifferentiable in terms of human geography, and Mediterranean climate involving winter rainfall at relatively low temperatures. The latter type of climate permits some soil moisture storage, enabling extensive dryland farming. Everywhere else agriculture is practiced only in river basins where extensive irrigation is possible or in those rare regions of high rainfall. Today, the overwhelming population majority lives in the irrigated areas. In the Mediterranean climatic areas, aridity increases southwards and eastwards, while precipitation increases with elevation. Rivers having their source regions within the Middle East have a high ratio of runoff to precipitation. Potential evapotranspiration data indicate that regions of annual water surplus are relatively rare. For the Middle East as a whole, 9% of the total land area is cultivated (25% of which is irrigated) and another 8% is potentially cultivatable. Water resource development must take place within rigid limitations and therefore has the greatest potential in river basins where potential crop productivity is the highest. Several major river irrigation projects are outlined: the Tigris and Euphrates, within Syria, Iraq and Turkey, the Jordan-Yarmuk, within Jordan and Israel and the Nile, within Egypt. It is shown that required capital is available and much can be done, but that political and social problems in the area present major obstacles to development. (Casey-Arizona)

RETURNS FROM DRYLAND FARMING IN THE TRIANGLE,
Montana Agricultural Experiment Station, Bozeman. Dept. of Agricultural Economics and Rural Sociology.
M. E. Quenemoen, and Robert F. Bucher.
Montana Agricultural Experiment Station, Bulletin 626, Apr 1969. 40 p, 33 tab, 33 ref.

Descriptors: *Dry farming, *Return (Monetary), *Evaluation, *Economic efficiency, *Farm management, Salvage value, Assets, Montana, Economic prediction, Market value, Land resources, Income analysis, Employment opportunities, Wheat, Prices, Cost analysis, Profit, Harvesting, Budgeting, Constraints, Unit costs, Acreage, Analysis, Farm prices, Farm units.
Identifiers: Triangle Area (Mont), Great Falls (Mont), Havre (Mont), Shelby (Mont), Big Sandy (Mont).

This study evaluates returns from dryland farming in the Great Fall, Havre and Shelby area of Montana to determine if they are adequate to pay going market prices for land and if they give operators returns equal to non-farm employment. Wheat is the principal crop. Cost returns are based on the

difference between aquisition (asset price plus cost of acquisition, or total cost to buyer) and salvage (asset price minus marketing cost, or net receipts to a seller) values. Factors which influence farm operation beside maximum profit are outlined. Farms are classified according to 4 harvesting sizes - 400, 900, 1500, and 2400 acres. Budgets are developed from 16 farms near Big Sandy, supplemented by agricultural engineering reports. Returns to operators, based on acquisition values, were -$225, -$292, -$279, and $3368 for the 400-, 900-, 1500-, and 2400-acre farms. Returns to operators, based on salvage values were $1407, $3118, $5370, and $11711 for the 400-, 900-, 1500-, and 2400-acre farms. Dry-land farming returns are particularly unfavorable to young farmers who have higher potential returns in non-farm employment. Internal pressures operating to favor returns on farm enlargement are (1) rapidly decreasing unit costs as farms increase toward 900 acres, (2) greater net income from larger acreage, and (3) excess machinery capacity on smaller farms. Appendixes describe and summarize farm budgets for the 4 acreage sizes. Thirty-three tables compare costs, returns, models, land and machinery values, and capital investments. (Popkin-Arizona)

AGGREGATE SUPPLY RESPONSES FOR EASTERN COLORADO WHEAT FARMERS,
Economic Research Service, Washington, D.C. Farm Production Economics Div.; and Colorado State Univ., Fort Collins. Dept. of Economics.
Harry G. Sitler, and Melvin D. Skold.
Colorado State University Experiment Station, Technical Bulletin 104, Apr 1969. 55 p, 45 tab, 3 fig.

Descriptors: *Dry farming, *Limiting factors, *Soils, *Precipitation (Atmospheric), *Return (Monetary), Colorado, Wheat, Crop production, Harvesting, Pastures, Acreage, Farm management, Cost allocation, Labor, Capital, Livestock, Farm prices, Supply, Computer programs, Grains (Crops), Budgeting, Economic efficiency, Income.

Precipitation and soils are the most important factors limiting wheat production, the best adapted cash crop, in eastern Colorado. Average annual precipitation ranges from 13 to 19 inches. Nonirrigated cropland soils are heavy or sandy. Wheat is adapted to this area because it can be produced under dryland conditions. Wheat cropland is about 6,857,050 acres. Eastern Colorado is divided into 5 adjustment areas based on (1) wheat percentage harvested, (2) wheat yield per planted acre, and (3) cropland to pasture ratio. Data on soil, precipitation, crop activities and yields, machinery costs, labor and capital availability, livestock activities, and prices were collected. Supply responses were developed from historical records and computer linear programming. Responses are discussed and compared as low, low-medium, medium, high-medium, and high feed grain prices. Supply responses were greatest for medium feed prices. Farmer response to price change depends on many factors. Crop and livestock enterprise budgets, developed for major precipitation zones, show costs and outputs. Tables and figures include wheat response curves, and economic data for the 5 adjustment areas. (Popkin-Arizona)
W71-07827

AGRICULTURAL FLAMING FOR INSECT AND WEED CONTROL IN COLORADO,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
Ralph W. Hansen, and Robert G. Simpson.
Colorado State University Experiment Station, Bulletin 538S, Dec 1969. 9 p, 3 tab, 7 fig, 3 ref.

Descriptors: *Insect control, *Weed control, *Lethal limit, *Water yield improvement, *Burning, Water conservation, Insects, Weeds, Colorado, Evaluation, Soil moisture, Alfalfa, Chlorinated hydrocarbon pesticides, Life cycles, Insect behavior, Crop production, Sugar beets, Irrigation ditches, Costs, Water utilization, Larvae, Ditch grass, Hazards, Breeding.
Identifiers: *Weevils.

The effectiveness of flame treatment to control insects and weeds is evaluated at the Colorado State University Experiment Station. Weeds not only use soil moisture, but provide breeding grounds for insects which infest irrigated crops. Flaming treatment is an alternative to chlorinated hydrocarbons, which present health problems by residue. Life cycle and habits of weevil are discussed. Flaming brings weevils to lethal temperatures at 200 degrees F. Only limited success was achieved from 1964 to 1968. An extensive 1968 field study by alfalfa growers did not show flaming to be effective against weevils. Flaming controls weeds when heat application is adequate to rupture plant cells. Weed control was most effective during dry periods with no wind. Flaming on yield and sugar content of sugar beets was found to be an effective weed control. Flaming to control weeds along irrigation ditches is an established Colorado practice. Such control is possible at low cost with no residue danger, and good trash elimination. Water is used efficiently with less loss in clean ditches where weed seed distribution is reduced. Figures show extent of weevil infestation in the United States, adult and larvae weevils, pupation within cocoon, plot experiments and hooded flamer. Tables show effect of flaming on yield, weed content, protein content, sugar beet yield, sucrose content, and ditch flaming costs. Ditch flaming costs at Arkansas Valley Branch Station for single burning of 6-foot width from 1963 to 1967 ranged from $5.46 to $8.17 per mile. (Popkin-Arizona)

RESOURCES, COSTS AND RETURNS ON CATTLE RANCHES IN THE MOUNTAIN AREAS OF COLORADO BY SIZE OF RANCH,
Colorado State Univ., Fort Collins. Dept. of Economics.
C. Alan Nelson, and Melvin D. Skold.
Colorado State University Experiment Station, Technical Bulletin 101, Mar 1969. 45 p, 14 tab, 1 fig.

Descriptors: *Resources, *Costs, *Return (Monetary), *Cattle, *Range management, Mountains, Colorado, Ranges, Livestock, Evaluation, Analysis, Resource allocation, Economic efficiency, Irrigated land, Water management (Applied), Flood irrigation, Gross income, Operating costs, Resource development, Productivity.
Identifiers: *Resource management, *Beef production.

A 6-county mountainous area in Colorado was evaluated in terms of resources, costs and returns on cattle ranches by 40 interviews. About 85% of the ranchland is irrigated, and more than 90% of the ranches have irrigation. Livestock production of feeder calves is the predominant enterprise, where private and/or public rangeland provide summer feed, and irrigated meadows provide winter feed. Management and allocation of water on native hay meadows, generally by flood irrigation, is essential to proper range production. Five ranch sizes (74, 181, 254, 321, and 764 animal units) do not differ in productivity. Beef production, sales, and gross income are proportional to resources employed because of the extensive nature of ranching. The 181-and 254-animal units spend less per pound of beef produced than the 74, 321, and 764 units. Cash costs are the largest costs. Productivity index, and production per unit of input has not increased as rapidly as the index of operating expense per production unit. None of the ranches analyzed are making economically adequate returns. Resource adjustment and management may increase ranch income. Detailed analyses of resources allotment will be considered in future studies. Fourteen tables summarize pertinent resource, cost and returns data. (Popkin-Arizona)
W71-07829

THE ECONOMICS OF CROPPING SYSTEMS FOR WESTERN COLORADO,
Economic Research Service, Washington, D.C. Farm Production Economics Div.
C. Kerry Gee, and C. W. Robinson.
Colorado State University Experiment Station, Bulletin 539S, Dec 1969. 34 p, 21 tab, 4 ref, 1 fig.

Descriptors: *Economic efficiency, *Evaluation, *Analysis, *Rotations, *Farm management, Colorado, Consumptive use, Irrigation practices, Crop production, Alfalfa, Corn (Field), Grain (Crops), Sugar beets, Barley, Profit, Computer programs, Average prices, Farm prices, Risk, Labor, Capital costs, Budgeting, Pricing, Selectivity, Planning, Income.

The economics of consumptive use and irrigation water requirements are evaluated for cropping patterns in western Colorado. A cropping system consists of a single crop grown continuously or a combination of crops grown in sequence or rotation. A rotation consisting of alfalfa for 3 years followed by corn for grain, sugar beets and barley as a nurse crop is the most profitable rotation tested. Analysis is based on linear programming, using average prices. Profits were maximized on rotation schemes when sugar beet prices were from $14.13 and $16.17 per ton, and when corn prices did not rise above $2.74 per cwt. Combining crop and livestock enterprises frequently increases farm profits. Farm managers should consider price risks, labor, capital investments, financial risks, livestock, and cropping patterns. Budgeted cropping systems, optimum cropping systems with and without livestock, changing prices, and cropping-system selection are discussed. A figure shows optimum rotations with various sugar beet and corn prices. Twenty-one tables show prices, assumptions, budgets, optimum enterprise combinations, and cost and production. PROBLEMS OF WATER SUPPLY FOR AGRICULTURAL OPERATIONS IN LOWER WEST BENGAL,
Calcutta Univ. (India).
K. Bagchi, and R. Bhattacharyya.
Indian Geohydrology, Vol 5, No 1, p 90-93, Dec 1969. 4 p, 1 tab, 4 ref.

Descriptors: *Water supply, *Floods, *Drought, *Hydrologic data, *Planning, Water resource development, Water management (Applied), Data collections, Statistics, Precipitation (Atmospheric).
Identifiers: *India, West Bengal (India).

An attempt is made to interpret the precipitation data of Lower West Bengal (india) for the last 70 years in terms of water availability and the periodicity of supply. A study of the actual rainfall for the period (1891 to 1950) reveals that for the region as a whole the chances of experiencing extremely heavy rainfall (above 1905 mm) is much less than its experiencing scanty rainfall. Except for the western part, the region is not only a lowland but also carries several channels which bring water from regions lying outside the study area. Abnormalities caused by excess rainfall beyond the region, both simultaneously and in periods when the channels are full, may play havoc with the standing crops. (Knapp-USGS)

METEOROLOGY AND THE MIGRATION OF DESERT LOCUSTS: APPLICATIONS OF SYNOPTIC METEOROLOGY IN LOCUST CONTROL,
World Meteorological Organization, Geneva (Switzerland).
R. C. Rainey.

orld Meteorological Organization, Technical ote 54, WMO No 1388, TP 64, Anti-Locust lemoir 7, 1963. 109 p, 3 plates, 24 fig, 2 tab, 1 p, 631 ref.

escriptors: *Arid lands, *Insects, *Meteorology, nsect behavior, *Weather patterns, Insect con-ol, Foreign countries, Meteorological data, inds, Migration, Maps.
entifiers: *Desert locusts, *Africa, *Asia, *Crop mage.

esert locust crop destruction is still a serious oblem in more than 30 countries of arid or semi-id Africa and southeast Asia. Huge amounts of ant material are consumed by migrating swarms, d many tons of dead locusts can be recovered by ensive airplane-spraying of a concentrated arm. Displacement of swarms in relation to eteorological factors encountered in migration n aid in forecasting locust attacks. Movements of grating locusts appear to be greatly influenced lowlevel windfields which they encounter. Many tailed maps, graphs, and photographs show arm movement, meteorological factors encoun-ed, orientation of individuals within swarms, and cations and times of egglaying in relation to the pearance of young swarms. GRICULTURAL PRODUCTION IN IR-GATED AREAS,
ah State Univ., Logan.
ynne Thorne.
esented at an international conference, 'Arid nds in a Changing World', Tucson, Arizona, ne 1969. In: Arid Lands In Transition, Dregne, H ed), p 31-56, Pub No 90, AAAS, 1970. 5 tab, 17 .

escriptors: *Agriculture, *Crop responses, *Ir-ation programs, *Arid lands, *Economic ects, Soil groups, Water resources development, reign lands, Irrigation practices, Irrigation ef-ts.
entifiers: *Developing nations.

id lands present many benefits to potential ricultural efforts. The limited leaching over time ves most of these regions rich in nutrients, ex-ting N. The lack of precipitation facilitates a ecisely timed, diversified irrigation agriculture ce rainfall often disrupts farm operations. It is gued that while arid land development involves h costs, the traditional considerations of cost-nefit analyses are inadequate criteria. Present ta indicate that 22% of all potentially arable land the world is in arid or semiarid climatic zones. st of this involves desert and nonvolcanic brown l groups. Of the 56 nations inventoried, an erall average of 14% of total arable land is ir-ated. A weighted average of estimated develop-nt costs was 980 dollars per ha., with irrigation uipment adding 250 or more dollars per ha. The oblems of irrigated agriculture are discussed for veral selected arid regions. The western W.S. has en experiencing spiralling population increases ich may greatly affect land uses, water consump-n priorities and public land priorities. However, ecise predictions are not yet possible. Problems the Middle East, North Africa, West Pakistan, dia and Australia are also discussed in some tail. The Indian practice of spreading available igation water as thinly as possible over extensive croplands brings out the basic question of limited vs. adequate water application. While it is stressed that there is no universally applicable answer, much research indicated productivity/unit of land or labor is greater in intensive water use situations. A critical problem in developing nations is the layering of expensive irrigation investments over traditional farm management practices. Also, construction promoters have too long been a dominating force in irrigation development. (Casey-Arizona)

EVALUATION OF CLIMATOLOGICAL RECORDS FOR RATIONAL PLANNING OF LIVESTOCK SHELTERS,
Department of Agriculture, Columbia, Mo. Livestock Engineering and Farm Structures Research Branch; and Environmental Science Services Administration, Columbia, Mo.
Leroy Hahn, and James D. McQuigg.
Agricultural Meterology, Vol 7, No 2, p 131-141, Mar 1970. 5 fig, 5 tab, 12 ref.

Descriptors: *Livestock, *Meteorological data, *Farm management, *Model studies, *Forecasting, Optimization, Efficiencies, Economic prediction, Economic feasibility, Productivity, Structures.
Identifiers: *Livestock shelters.

The most efficient relationships between livestock yield, weather, and climate, allow animals to maintain normal body temperature without decreased production or increased feed intake. Climatological records can be evaluated to determine the feasibility of erecting livestock shelters. By a system of calculating the probability of the frequency of a certain weather event, and measuring that event's effects on production, the profitability of erecting shelters can be estimated. Weather records and probability values for sixteen United States stations are used as examples. The most extensive application of this system is in milk production of dairy cattle, but modification of the system for egg production is underway. (Yensen-Arizona)

EVALUATIONS OF GRASSES, LEGUMES, AND GRASS LEGUME MIXTURES FOR IRRIGATED PASTURES GRAZED BY SHEEP UNDER VARIOUS FERTILITY AND MANAGEMENT PRACTICES,
Agricultural Research Service, Flagstaff, Ariz. Crops Research Div.
F. B. Gomm.
Montana Agricultural Experiment Station, Bulletin 618, Feb 1969. 34 p, 21 tab, 14 fig, 14 ref. Experiment Station Project M.S. 826.

Descriptors: *Grasses, *Legumes, *Varieties, *Rotations, Pastures, Irrigated land, Grazing, Sheep, Fertility, Management, Montana, Crop response, Soil structure, Productivity, Erosion control, Performance, Soil properties, Environmental effects, Nitrogen, Return (Monetary), Carrying capacity, Weight, Crop production, Forages, Proteins, Phosphorous, Calcium, Alfalfa, Winter killing, Orchard grass.

Many irrigated croplands in Montana were converted to 206,000 acres of irrigated pasture from 1954 to 1961. Grazing rotation is an important management policy to maintain soil structure and production, and control erosion. This report summarizes the performance of several grasses and legumes alone and in combination with sheep grazing in irrigated pasture: (1) Results from 3 years of grazing legumes, grasses and mixtures, (2) conclusions from 5 years simple and complex mixtures, (3) summary of grazing on a fertilized pasture, and (4) results of 3 year management studies on 3 pasture mixtures. Irrigated mixtures should consist of one grass and one legume, where selected species meet management needs, soil conditions, and other environmental characteristics. Nitrogen fertilization of grass pastures gives economical returns in carrying capacity, weight gains, and herbage yields, though management practices influence pasture productivity. The reliability of animal-weight-change method of determining total digestible nutrients is questioned. Lambs use pastures more efficiently than yearling ewes for gains. Legume percentage and protein content of herbage fluctuates, though phosphorous and calcium decrease in older pastures. Alfalfa-grass pastures are susceptible to winter kill and may cause bloating. Birdsfoot trefoil and orchardgrass are excellent legume and forage. Tables and figures quantify these results. (Popkin-Arizona)

Identifiers: *Progress reports, *Panhandle Agricultural Experiment Station, Semiarid lands, Green bug, Residue, Infestation, Buffalo grass, Row spacing, Multicrop patterns, Rye, Crop failure.

The Panhandle Agricultural Experiment Station, in the semiarid high plains (Great Plains) of Oklahoma, has 43 acres of land for irrigation and dryland research. Field crop varieties, forages, fertility, residue management, plant population, and water management are studied. A late Spring freeze lowered wheat yields, and green sorghum reduced grain production in 1968. Results of 22 1968-69 projects are presented. These include irrigation research on small grains wheat fertility, moisture and nitrogen in wheat, moisture and buffalograss sod, row spacing, and multicrop patterns. Ryes produce a greater yield than wheats or barley for grazing grains. Irrigated wheat can be nitrogen fertilized economically in the plains. Greatest water-use efficiency by wheat occurs with lowest moisture level. Long-term climatic conditions are reflected in soil-moisture regime. The 40-inch row spacing of irrigated sorghum made poor use of field capacity. A wheat crop failure can be expected one-third of the time regardless of the management system. Corn and grain sorghum can successfully be produced after irrigated wheat. Expanding agriculture in the high plains justifies this research. Most of the studies are continuing. (Popkin-Arizona)

Grain sorghum is a commonly and economically important crop in Nebraska, and arid and semiarid lands. Economic and nutritious yields are the result of complex factors such as photosynthesis, translocation, respiration, and associated synthesis of grain storage products. Photosynthesis is the conversion of carbon dioxide and light energy to starch and protein. Photosynthesis efficiency is related to heat and moisture stress. Translocation is the migration of starch and protein to the head of the plant. Respiration and synthetic activities include energy production from stored protein and starch, and production of protein and starch from energy. Environmental stresses, such as heat and moisture extremes, require detailed investigation. Most plants have some tolerance to heat or drought, but not necessarily to both. Complex instrumentation is necessary to measure coordinated plant processes. Plant breeders would make rapid progress in increasing production if they knew the limiting factors, and their order of importance over various conditions. Such knowledge is the topic of future research. Figures show increases in Nebraska sorghum acreage and yield, radioactive isotope tagging of sorghum, and sorghum head. (Popkin-Arizona)

RE-USING IRRIGATION RUNOFF,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering and Natural Resources.
P. E. Fischbach, H. D. Wittmuss, and J. F. Decker.
University of Nebraska, College of Agriculture and Home Economics, Quarterly, Vol 14, No 4, p 15-16, Winter 1968. 3 fig.

Descriptors: *Water reuse, *Runoff, *Irrigation practices, *Water conservation, *Water management (Applied), Reservoir storage, Rainfall, Nutrients, Irrigation efficiency, Furrows, Piping systems (Mechanical), Cost comparisons.
Identifiers: Community risks, Underground pipe.

Irrigation runoff, which may constitute 20 to 40% of the water applied by conventional surface systems, can be saved by a re-use system which collects runoff at furrow ends, delivers it to the same or adjacent field from a small sump, dugout or reservoir. The storage reservoir is the heart of this system. Runoff from irrigation and rainfall can be salvaged this way. Re-using runoff would save water, labor and plant nutrients, and maintain high irrigation efficiency. Large furrows are more effective than small ones. Underground pipes may be used to redistribute the salvaged water. The cost of re-use water is about $4 per acre foot, which is equivalent to a 50-foot lift on an irrigation well. Reuse of runoff may reduce water costs, labor requirements, and community risks. Photographs show a sump, dugout, dam and pond for runoff reuse. (Popkin-Arizona)

RURAL-AGRICULTURAL WATER SUPPLY SYSTEMS: IRRIGATION,
Department of Agriculture, Washington, D.C.
Clifford Dickason, and Howard Hill.
In: Public Facility Needs, Washington, DC, 1966, p 125-136.

Descriptors: *Irrigation, *Water supply, *Investment, Costs, Lakes, Streams, Reservoir, Groundwater, Canals, Capital, Cost, Financing, Taxes, Government, Water resource development, Forecasting.
Identifiers: *Public facilities, Conveyance systems, User charges.

A survey was made of irrigation water supply systems that are either public facilities or group facilities operated by various types of irrigation water organizations such as mutual irrigation organizations, commercial water suppliers, irrigation districts, the Bureau of Reclamation, the Bureau of Indian Affairs, and certain states and cities. The nature and composition of irrigation facilities is presented with a description of the facilities and a discussion of existing capital plant in the U.S. This includes growth, ownership proportions and current economic value of the facilities. Construction, operation, and maintenance costs are presented, together with user charges. The trend of capital outlays is cited by accounting for new investment in irrigation, proportions of capital outlay by organizations, and various means of financing. Finally, a projection is made, extending to 1975, of changes in irrigated acreage and development that accounts for both Federal and non-Federal investment in the development of the irrigation aspect of water resources. FLOOD CONTROL PLANNING IN ARIZONA,
Corps of Engineers, Los Angeles District, Calif.
Alan Chapman.
Proceedings, 14th Annual Arizona Watershe Symposium, Phoenix, Sept 23, 1970, p 20-2 1971. 4 fig.

Descriptors: *Planning, *Flood control, *Arizon *Land use, *Channel improvement, Non-structur alternatives, Flood plains, Flood plain zonin Waterproofing, Water conservation, Geographic regions, Federal government, Inter-agenc cooperation, Arid lands, Regional analysis, Vegeta tion, Economic feasibility, Cost-benefit analysi Environmental effects.
Identifiers: *US Army Corps of Engineers.

The Army Corps of Engineers is described as federal agency dedicated to improvement of na tional water resources. The Corps is aware of en vironmental problems associated with its projec and hopes to achieve balanced programs throug cooperation with other involved federal, state an local agencies, surveys involving regional growt and future regional needs and studies of alternat approaches to given problems. A number o proposed and actual studies of Corps flood-contro planning work are described for Arizona. A stud of the Rillito Creek near the city of Tucson is ou lined in detail. The creek and its tributaries co stitute a flood plain which effects much of th groundwater recharge of the area. Although th area is sparsely populated, periodic floods caus much damage. A regional study involving vegeta tion, soils and local land use and population trend was undertaken in cooperation with local interest The aim was to insure that environmental factor were included in the overall planning process. was concluded that only channel improvements t control a discharge of 24,000 cubic feet/sec., flood frequency of once in 50 years, were economi cally feasible. At a public hearing in Tucson, Jun 1970, four alternative plans were presented: (1) N flood control project (2) a 12 mile earth-bottom channel with stone revetted banks (3) a 10 mil earth-bottom structural measures, a combinatio of zoning and water proofing (4) a 10 mile earth bottom channel with stone-revetted banks com bined with flood plain management. ASWAN DAM LOOSES A FLOOD O PROBLEMS,
Claire Sterling.
Life, Vol 70, No 5, p 46-46A, 12 Feb 1971.

Descriptors: *Dams, *River basins, *Salinization *Silts, *Arid lands, Political aspects, Social aspects Ecology, Hydroelectric power, Saline soils, So erosion, Fertility, Deltas.
Identifiers: *Egypt, *Aswan High Dam, *Nil River, *Developing nations.

For millenia, the Nile River has supported agricul ture in the Nile Valley by its annual flooding cycle The silts deposited by the floodwaters have main tained a high level of soil fertility and created th Nile Delta. Additionally, flood waters washed awa salt accumulations resulting from agricultural ac tivities. Since 1964, the Aswan High Dam ha eliminated annual flooding by backing up wate into Lake Nasser, and since 1967, it has bee producing hydroeletric power. The aim of the dam has been to permit double-crop agriculture by canal irrigation, flood elimination and powe production. Since the dam began operation, soi salinity levels have risen ominously, increasing amounts of acreage need artificial fertilzer and ero sion is eating at the Delta coastline, now exposed to the full force of marine currents. Bilharziasis, a de bilitating disease caused by a parasite carried by water snails, has shot from 0% to 80% in areas o newly-built canals. Control of the snails was for merly effected by the dry periods after the floods and the canals encourage the spread of snails. Because the fresher Nile waters no longer dilute Red Sea waters flowing into the eastern Mediterranean, marine ecologic upheaval has resulted, en-

ering the fishing industry of the entire area. ough the government hoped to reclaim),000 acres, so far less than 300,000 acres been reclaimed. Lake Nasser losses of water gh underground seepage and evaporation are nous. Because of the environmental damage it reated, the dam has greatly impoverished an ly destitute nation. (Casey-Arizona)

D PLAIN INFORMATION, BAYOU METO RIBUTARIES, JACKSONVILLE ARKAN-
f Engineers, Vicksburg, Miss.

Corps of Engineers Flood Plain Report, Aug 7 p, 25 fig, 27 plate, 9 tab.

Descriptors: *Floods, *Flood damage, *Arkansas, Flood plains, Regional flood, Flood forecasting, Flood control, Historic flood.
Identifiers: *Jacksonville (Ark), Standard Project Flood, Intermediate regional flood.

Flooding along Bayou Meto and its tributaries at Jacksonville, Arkansas and vicinity is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and text material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall runoff, historical flood heights and other technical data. The greatest flood known to have occurred in the vicinity of Jacksonville was in February 1969. However, the upper portion of the Bayou Meto Basin in the vicinity of the State Highway 5 Bridges across Bayou Meto and Kellogg Creek and above is subject to localized flash flooding and records show a lack of continuity with the more generalized flooding downstream. The maximum flood height recorded at the State Highway 5 Bridge across Bayou Meto was in May 1954 with an elevation of 253 ft above mean sea level. The maximum flood height at the State Highway 161 Bridge across Bayou Meto, 6.9 miles downstream, was in February 1969 with an elevation of 244 ft. On Bayou Two Prairie, 1969 high water marks were recorded at elevation 249 ft at the Section Line Road Bridge at Mile 45.5 and further upstream at the Missouri Pacific Railroad Bridge over Jack Bayou high water marks indicate a flood crest elevation of 251 ft. (Woodard-USGS)

FLOOD PLAIN INFORMATION, MIDDLE FORK FORKED DEEP RIVER AND TRIBUTARIES, VICINITY OF HUMBOLDT, TENNESSEE.
Corps of Engineers, Memphis, Tenn.

Army Corps of Engineers Flood Plain Report, Feb 1970. 45 p, 11 fig, 15 plate, 6 tab.

Descriptors: *Floods, *Flood damage, *Tennessee, Flood plains, Regional flood, Flood forecasting, Flood control, Historic flood.
Identifiers: *Humboldt (Tenn) area, Standard Project Flood, Intermediate regional flood.

Flooding in the Humboldt, Tennessee area along the Middle Fork Forked Deep River and its tributaries is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and text material relating the extend of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. Durations of floods are relatively short on the streams in the vicinity of Humboldt. During the flood of January 1956 the middle Fork Forked Deer River rose to its crest stage in about two days at a maximum rate of rise of about 0.4 foot per hour and remained out of its banks for nine days. The overall ranges in stage on the tributary streams are less than those for the Middle Fork Forked Deer River, and these streams rise to their peak in only a few hours. (Woodard-USGS)

LONG-RANGE FORECASTS OF RUNOFF FROM MOUNTAIN RIVERS OF SIBERIA (RUSSIAN: DOLGOSROCHNYYE PROGNOZY STOKA GORNYKH REK SIBIRI),
A. A. Kharshan.
Gidrometeorologicheskiy Nauchno-Issledovatel'skiy Tsentr SSSR Trudy, No 65; Leningrad, 1970. 210 p, 57 fig, 34 tab, 240 ref.

Descriptors: *Runoff forecasting, *Hydrologic data, *Water resources, *Runoff, *River forecasting, Base flow, Rainfall-runoff relationships, Discharge (Water), Snowmelt, Topography, Geomorphology, Hydroelectric plants, Reservoir storage, Seasonal, Inflow, Meteorological data, Hydrogeology, Hydrography, Precipitation (Atmospheric), River basins, Snow surveys.
Identifiers: *Siberia, *Mountain rivers, Meteorological satellites.

Methods for long-range forecasting of runoff from Siberian mountain rivers are based on a study of runoff in the Irtysh, Ob', Yenisey and Angara River basins. Principal aspects of runoff considered are volume of spring-summer high water, average monthly and maximum discharges of water in spring and summer, monthly and quarterly runoff during summer-fall and winter seasons. For rivers of the Altay, Western Sayan and western slope of Eastern Sayan, snowmelt is 65-70% of high water runoff and 45-50% of annual runoff, while rainfall runoff is 20-25% and 40-45%, respectively. For waters of the eastern slope of Eastern Sayan and the Lake Baykal basin, snowmelt is 50-60% of high water runoff and 25-30% of annual runoff, while rainfall runoff is 30-40% and 60-65%, respectively. Glacier runoff only plays an important role at the upper reaches of high-mountain rivers of the Altay. Steady groundwater flow for all rivers is 10-15% of annual runoff. Generally, the ratio between snowmelt and rainfall runoff becomes less favorable for forecasting spring and summer-fall flow as one proceeds eastward. For the first time methods were worked out for long-range forecasting of water inflow to reservoirs of large hydroelectric power stations in Siberia, although formulation of runoff forecast methods for Siberian mountain rivers is complicated by lack of observations of snow cover, precipitation and other meteorological factors in mountains. (Josefson-USGS)

HYDROLOGICAL FORECASTS AND MODERN COMPUTERS,
Gidromteorologicheskii Nauchno-Inssledovatelsii Tsentr, Moscow (USSR).
L. S. Kuchment, and Ye. P. Chemerenko.
Trans from Zemlya i Vselennaya, No 3. Foreign Technology Div., Wright Patterson AFB, Machine Transl FTD-MT-24-193-70. Available from National Technical Information Service as AD-716 942, $3.00, paper copy, $0.95 microfiche.

Descriptors: *Hydrology, *Forecasting, *Surface waters, *Mathematical models, *Computers, Meteorology, Data collections, Streamflow, Precipitation (Atmospheric), Hydrographs, Weather forecasting, Flood forecasting, Runoff forecasting.

Every year the Hydrometeorological Center USSR issues more than 100,000 hydrological forecasts and warnings. This center is in charge of scientific and methodological work in this field, makes forecasts and issues a hydrological bulletin containing information on the general status of rivers, lakes and reservoirs in different regions of the USSR. In the regional administrations of the Hydrometeorological Service there are forecasting bureaus which prepare and disseminate hydrological forecasts. Any further development of hydrological forecasts or improvement in the advance time of forecasts is dependent on the mathematical description of hydrological processes and the relationships between individual hydrometeorological elements. Until recently forecasts have been based on simple physical or statistical relationships, which are entirely inadequate considering the complexity of the elements involved. Soviet scientists have developed a physical theory of the development of hydrological processes which can serve as a good basis for constructing reliable mathematical models. (Woodard-USGS)

Descriptors: *Drainage patterns (Geologic), *Natural streams, *Computer models, *Mountains, *Virginia, Tennessee, Topography, Hydrology, Geology, Lithification, Data collections, Runoff, Computer programs.
Identifiers: *Drainage networks, Clinch Mountain (Va and Tenn).

Clinch Mountain, in southwestern Virginia and northeastern Tennessee, is a long homoclinal ridge with a dip angle that varies along the strike. The base width and height both decrease with increasing dip, so that the mountain provides an excellent example of a system with uniform lithology and structure but varying structural parameters. Various properties of the stream networks on both the dip and scarp slopes were measured and analyzed as a function of dip angle. A random-walk headward-growth model of stream network development was used to simulate the Clinch Mountain network; the criterion for a successful simulation was that the simulated and actual networks should have statistical geometrical similarity. Satisfactory results were obtained if both the reduced width (product of width and drainage density), and the number of outlets per unit length were assigned as input parameters. (Woodard-USGS)

Available from the National Technical Information Service as PB-197 510, $3.00 in paper copy, $0.95 in microfiche. Report REC-OCE-70-21, Aug 1970. 162 p, 52 fig, 16 tab.

Descriptors: *Reservoir surveys, *Reservoir silting, Aggradation, Core drilling, *Geodetic surveys, First order surveys, Land subsidence, *Gamma rays, Rebound, *Hydrographic surveys, Sounding, Photogrammetry, Thalweg, Topographic mapping, *Sedimentation, Fluvial hydraulics, Unit weight, Sediment transport, Sediment sampling, *Physical properties, Watersheds, Basins, Trap efficiency.
Identifiers: Reservoir capacity, Gamma probes, Arizona-Nevada, *Lake Mead.

The 1963-64 Lake Mead survey was run to compute the reservoir capacity. Results of the geodetic and hydrographic surveys and sediment sampling equipment are described. The geodetic survey showed Hoover Dam subsided an average of 118 mm since 1935. Sonic sounding, photogrammetry, and cross-sectional profiling methods were used to run the hydrographic survey. Reservoir area and capacity tables were generated using an electronic computer. The present lake capacity is 29,755,000 acre-ft and the reservoir surface area is 162,700 acres at elevation 1229 ft. 2,720,000 acre-ft of sediments accumulated in the lake since 1935. A unit weight of 60 lb/cu ft was determined representative of the deposited sediments. Samples were collected from the major basins with a piston core sampler. A gamma probe was used to measure in situ wet bulk densities. Special sampling with a drill rig was conducted in Pierce Basin representing the sediment accumulation in the delta area. The reservoir trap efficiency is judged to be 100%.

EFFECT OF FLAT BOG DRAINAGE ON THE RUNOFF REGIME OF SPRING HIGH WATER AND SUMMER FLOODS (RUSSIAN: VLIYANIYE OSUSHENIYA NIZINNYKH BOLOT NA REZHIM STOKA VESENNEGO POLOVOD'YA I LETNIKH PAVODKOV),
Ministry of Land Reclamation and Water Economics, Minsk (USSR).
V. F. Shebeko.
Meteorologiya i Gidrologiya, No 12, p 52-58, Dec 1970. 7 p.

Descriptors: *Drainage effects, *Bogs, *Surface runoff, *Soils, Land reclamation, Wetlands, Base flow, Floods, Hydrogeology, Geomorphology, Saturated soils, Watersheds (Basins), Gaging stations, Soil physical properties, Storage capacity.
Identifiers: *Belorussia, Rain floods, Maximum discharge.

The effect of flat bog drainage and reclamation on the maximum runoff of spring high water is examined from long-term data of 10 gaging stations on reclaimed and undrained bogs of the Belorussian SSR. The Wetlands cover a bog area of more than 300 square kilometers and have similar soil, hydrogeological and geomorphological characteristics. Analyses of the soils physical properties, hydrogeology and geomorphology show that runoff conditions prior to basin drainage are homogeneous for the entire bog area. Studies of spring high-water maxima indicate that spring high-water formation conditions for drained and reclaimed bogs are subject to maximum variability, with the storage capacity of peat soils, soil freezing, surface runoff and melt water infiltration conditions varying more than on undrained bogs. Long-term observations reveal that there is essentially no surface runoff from reclaimed bogs during the summer and fall. The influence of bog drainage and reclamation on maximum flood runoff is evidenced from a decrease in maximum discharge of flood water as the size of drained bog areas increases. Generally, bog drainage and reclamation have little effect on rain flood maxima. (Josefson-USGS)

THE WATER BALANCE AND ITS TRANSFORMATION IN THE USSR (RUSSIAN: VODNYY BALANS SSSR I YEGO PREOBRAZOVANIYE).

Moscow, 'Nauka' Publishing House, 1969. 337 p, 69 fig, 140 tab, 429 ref.

Descriptors: *Water balance, *Water resources, *Hydrologic cycle, *Meteorological data, *Streamflow forecasting, Water conservation, Water utilization, Evaporation, Water supply, Water storage, Runoff, Forecasting, Soils, Rivers, Agronomic crops, Base flow, Precipitation (Atmospheric), Soil management, River basins.
Identifiers: *USSR, Agricultural practices, Zonal patterns, Regionalization, Soil zones, Mountain regions.

A forecast method is given for examining the effects of agriculture and forest management on water balance and streamflow in the USSR, with estimates of management influence projected to the year 1980. Studies were conducted in districts near Moscow, in the southern Transvolga and, during the last few years, in the Kursk Oblast. To study the natural water balance, a new geographic method takes into account the rock and soil elements of the water cycle and establishes relationships between groundwater flow, surface runoff, and soil moisture content. The first section of the three-part monograph is devoted to a study of zon patterns of water balance and and to the use of th geographic method for studying water balance mountain regions. Results of investigations of wat balance transformations are discussed in terms the influence of various agricultural practices in t Ukraine, Kazakhstan and Western Siberia. T concluding section examines problems of wat balance control and the principles underlying r tional use and conservation of the water resourc of the USSR. (Josefson-USGS)

A STORM DRAINAGE AND OPEN SPA MASTER PLAN FOR HAMILTON COUNT OHIO.
Consoer, Townsend and Associates, Chicago, Ill.

Hamilton County Regional Planning Commissi Cincinnati, Ohio, Dec 1966. 77 p, 15 fig. HU Urban Planning Project -- Ohio P-53.

Descriptors: *Flood control, *Drainage progra *Flood protection, *Cost-benefit analy *Planning, Flood plain zoning, Floodproofi Land use, Administration, Drainage practic Storm runoff, Urbanization, Financing, Eros control, Sedimentation, Ohio.
Identifiers: *Open space, Flood hazards, Flo prevention, Master plan.

A long-term strategy and conceptual plan w developed for providing storm drainage and op space in Hamilton County, Ohio. A complete ventory was made of all streams, culverts a bridges having tributary drainage areas grea than 300 acres. These are shown on maps i separate appendix. The study develops a meth for determining flood flows for the structures a streams, establishes the design flows, and prese findings of the adequacy of all structures a streams with suggestions for improvement there Information is given on present and future flo hazards, erosion and siltation problems, and op space land needs. Also included are suggestions subdivision regulations, legislative guidelines, a suggestions for financing and administering the provement programs that are adopted. The st covers the main watercourses and their branche the seven major drainage basins of Hamilton Co ty and portions of the watersheds within the City Cincinnati that drain into County streams. major outlet channels within other incorpora areas in the County are also included. Recomm dations are made for improving 49 public str tures and 22.1 miles of streams. Estimated costs summarized, by drainage basin, in a separate pendix. A section is included on benefit-cost re tions in connection with expenditures of pu funds for drainage and flood control. (Poertner) W71-08122

Identifiers: *San Diego County (Calif), Channel improvement costs.

The computer program URB DRA CONS (Urbanization's Drainage Consequence) developed in this study provides a methodology to test both long and short-range consequences of varying forms of urbanization within flood plains and areas contiguous to flood plains. With this tool, planners and engineers can investigate a variety of land-use patterns to determine their downstream consequences in terms of the estimated cost of channel improvement for varying degrees of flood protection. URB DRA CONS has been tested, and it is now operational on the computer at San Diego County's Operation Center. The concepts involved in the development of the URB DRA CONS computer methodology are explained herein. Application of the methodology involves use of the County's IBM 1130 computer. The URB DRA CONS programs for use on this computer are listed in the appendixes of this report. The application of URB DRA CONS to the Los Coches Creek watershed is presented to serve as a specific example of the methodology. Finally, there is a discussion of program modifications, research gaps, and missing data which must be accounted for before the URB DRA CONS methodology can be directly applied to the complete development of a county-wide flood control master plan. PASTURE IMPROVEMENT THROUGH EFFECTIVE WEED CONTROL,
Agricultural Research Service, Lincoln, Nebr.
M. K. McCarty, and C. J. Scifres.
University of Nebraska, College of Agriculture and Home Economics, Quarterly, Vol 14, No 4, p 23-26, Winter 1968. 5 tab, 4 fig.

Descriptors: *Cutting management, *Weed control, *Reclamation, *Pasture management, *Herbicides, Weedicides, Nebraska, Pastures, Weeds, Grasses, Legumes, Ranges, 2-4-D, Fertilization, Forages.

Overuse and mismanagement caused degeneration of many acres of pasture and rangeland in Nebraska. Undesirable weeds replace the desirable grasses and legumes which are weakened by overuse. Mowing, herbicides and reseeding are evaluated as weed control tools for pasture management. Mowing is relatively ineffective. Good control is obtained on broadleaf weeds by 2,4-D ester, though some undesirable grasses such as prairie threeawn are difficult to control. Combination herbicides such as 2,4-D, picloram or dicamba with amitrole may control mixed broadleaf-prairie threeawn infestations. Fertilized grasses produce vigorous growth which resists weed infestation. Re-seeding is an effective restoration to forage; plowing the pasture and growing a row crop for one or more years will kill most weeds. Selection of proper herbicide and reseeding specie is important for effective weed control. Tables show results of 9-, 8-, 6-, 3and 2- year studies. Figures show effects of 2,4-D and picloram, structure of 2,4-D, picloram and dicamba, and a photograph of amitrole and picloram effectiveness. (Popkin-Arizona)

FLOOD PROTECTION AT CULVERT OUTLETS,
Colorado State Univ., Fort Collins.
D. B. Simmons, M. A. Stevens, and F. J. Watts.
Available from the National Technical Information Service as PB-196 972, $3.00 in paper copy, $0.95 in microfiche. Wyoming State Highway Dept, Planning and Research Division Report, 1970. 213 p.

Descriptors: *Flood routing, *Flood control, Flow, Flood protection, *Bridges, *Culverts, Riprap, Spillways, Outlet works, Drains, Abutments, Colorado, Testing.

Techniques for the design of stable rock-riprap protection in the vicinity of bridge crossings are computed from methods derived in other sources, and the properties are related to particle sizes for riprap protection of abutments and piers. Design steps for prototype bridge crossings are enumerated so that the hydraulic engineer may use this report as a design manual. An example of the design protection for a prototype bridge crossing is included to clarify the suggested design procedures. Riprap-protected spill-through abutments were constructed in the hydraulic facilities at Colorado State University in order to test the validity of the suggested design procedures. The results of this research will become the standard for establishing erosion protection required at bridges.

FLOOD CONTROL RELEASE OPTIMIZATION USING METHODS FROM CALCULUS,
Colorado Univ., Denver.
William C. Hughes.
Journal of the Hydraulics Division, ASCE, Vol 97, No HY 5, p 691-704, May 1971. 14 p, 4 fig, 5 ref, 2 append.

Descriptors: *Optimization, *Mathematical modeling, *Flood control, *Reservoir operation, *Networks, *Costs, Flow, Storage, Flood routing, Time, Damages.
Identifiers: Calculus.

A means for modeling the operation of a flood control reservoir as a minimization problem which yielded an optimum release schedule for a reservoir or network of reservoirs was presented. The

problem was formulated to use methods from calculus as a means for obtaining a minimum solution and could be altered to make use of mathematical programming techniques. The analysis was limited to the operation of a network of flood control reservoirs and assumed that decisions regarding size, location, scale of development, etc. were made. The solution involved discrete time increments and used Lagrange multipliers to minimize a loss or cost function which included both the future flood risk costs resulting from storage and direct downstream damage costs associated with the magnitude of reservoir releases. The cost function was developed along with two flow functions, derived from a reservoir routing equation and a channel routing equation, and storage for a single flood control reservoir, a network of flood control reservoirs in parallel, and a network of flood control reservoirs in series. A general solution of the problem was demonstrated both mathematically and graphically for the case of a single reservoir. With more than one reservoir in the network minimization became increasingly difficult and solution of a system of polynomials was required to obtain the minimum cost release schedule. Descriptors: *Linear programming, *Simulation analysis, *Streamflow, *Water supply, *Optimization, *Costs, *Operations, Reservoirs, Water demand.
Identifiers: Susquehanna River, Synthetic streamflow generation.

The techniques of linear programming, synthetic streamflow generation, and simulation were merged to derive operating rules for a multiple source water supply. The general approach was demonstrated for the Baltimore water supply; where upland reservoirs furnish water by gravity flow, and a backup supply delivers pumped water from the Susquehanna River. The objective was to find the optimal (least cost) set of release decisions for the reservoirs such that (1) demands were met a given percentage of the time; (2) shortages would not exceed a stated magnitude more than a given percentage of the time; (3) reservoir releases were within the capacities of either the withdrawal structure or the treatment plants; and (4) quantities of water pumped through the Susquehanna pipeline were within the capacity of the pipeline or treatment plant. Chance constrained linear programming was employed to select candidate operating policies under the given power rate schedule, which were subsequently tested by a simulation program for long-term performance. The linear programming (LP) problem was solved for four different demand levels for four different weighting factors for summer pumping and simulation runs were carried out. Results indicated that the overall system average monthly operating cost could be reduced by using the derived operating results while at the same time maintaining system performance levels. OPTIMUM DESIGN OF INTERBASIN TUNNEL SYSTEMS,
Florida Univ., Gainesville. Dept. of Civil Engineering.
B. A. Christensen, and Peter W. Bush.
Water Resources Bulletin, Vol 7, No 2, p 273-284, Apr 1971. 10 p, 3 fig, 2 ref.

Descriptors: *Optimization, *Computer programs, *Reservoir operation, *Tunnel design, *Inter-basin transfers, *Costs, *Discharge (Water), Decision making, Constraints, Energy losses.
Identifiers: Objective function.

A system involving an arbitrary number of subreservoirs discharging water by tunnel systems into a main reservoir was considered. All tunnels were flowing full and it was assumed that all elevations of water surfaces in the subreservoirs and discharges leaving these were known. An iterative differential-calculus method was developed for the determination of all tunnel sizes giving minimum total cost of the system using the total cost function as the objective function. The energy losses in the tunnels rather than individual tunnel diameters were chosen as decision variables and resulted in substantial simplification of the set of equations representing the constraints. In order to establish the objective function in terms of energy losses, discharges and expressions relating to energy loss to tunnel size was known in all tunnels. Influence of average construction cost per unit volume, tunnel roughness and cross-sectional shape was taken into consideration. The corresponding computer program for the general case was presented but the method may also be applied to pipe systems, open channel systems, or combined systems by introduction of proper cost functions for these conduits. Aquifers enclosed or confined by sediments t
impede or retard the vertical movement of grou
water generally leak. A stochastic dynamic p
graming model for the optimal operation of a co
posite system of two coupled leaky aquifers an
surface water subsystem is formulated and appl
to the Roswell basin in New Mexico. The opti
operating policies for the two coupled aquifers
the basin are influenced by the values added to
basin by different crops, by the amounts of wate
storage in the two aquifers, by the discount fac
and by mutual leakage of the aquifers. Some
these factors tend to increase whereas others t
to decrease the operating policy. The resultan
all these factors determines the final operat
decision rule. The magnitude and direction
leakage are determined by the relative storage
the aquifers. Coupled aquifer systems should
treated as single sources and considered only
conjunctive use. (Knapp-USGS)

iptors. *Irrigation systems, *Water sources, urface waters, *Water supply, Arid lands.
fiers: *Qanats, *Iran.

Ancient and modern dependence for irrigation and water supply of Iran's desert agriculture upon qanats, or underground water tunnels is reviewed. Some qanats are as long as 25 miles and carry water from wells which are 250 feet deep. Qanats are observable from afar as mounds of soil around ventilation shafts dug at intervals of 50 yards along the tunnels. The qanats also support a species of transparent, blind fish whose disappearance from a qanat is supposed to presage its drying up. 1961 statistics show approximately 20,000 qanats in use and supplying nearly one-third of the water needed for irrigation in Iran. Modern water demands for supporting Iran's cultivated lands, two-fifths of which is irrigated, will require supplementation from the reservoirs of large multipurpose dams. Terheran which once obtained all its water from qanats, now takes over one half from the Amir Kabir reservoir. (Cowgill-OWRR)

A PRELIMINARY 'LEAST COST' STUDY OF FUTURE GROUNDWATER DEVELOPMENT IN NORTHEASTERN ILLINOIS,
Illinois State Water Survey, Urbana, Ill.
A. F. Moench, and A. P. Visocky.
State of Illinois Department of Registration and Education, Springfield, Circular 102, 1971. 19 p, 4 fig, 3 tab, 10 ref.

Descriptors: *Water management (Applied), *Water supply, *Water costs, *Cost analysis, *Aquifers, Water sources, Water demand, Pumping, Water purification, Water treatment, Municipal water, Water requirements, Costs, Illinois, Lake Michigan, Simulation analysis.
Identifiers: *Northeastern Illinois, *Groundwater costs.

An estimate was made of the average cost of producing groundwater in northeastern Illinois and to treat it to make it comparable in quality with treated Lake Michigan water. A digital simulation model was used. The cost of raw and treated groundwater produced in quantities sufficient, in most cases, to meet the projected demand to 2020 was estimated for each township in the six-county area. Three sources of groundwater were considered: the shallow sand and gravel aquifers, the shallow dolomite aquifers, and the deep sandstone aquifers. Unit costs of wells, pumps, and rehabilitation were obtained for each aquifer in each township. These included both amortized capital costs and operation-maintenance-repair costs (in 1970 dollars). The costs of storage and distribution to consumers were not considered. Results showed that raw water varied in cost from as little as 2 cents per 1000 gallons to as much as 14 cents per 1000 gallons depending upon the depth to the deep sandstone water. The unit cost of treated water varied from 22 to 53 cents per 1000 gallons, the lower costs applying to the largest users because of the economy of scale in treatment. Also because of this economy of scale, the cost of treated water tended to decrease with time; the cost of raw water increased with time. Fourteen townships were found to be deficient in groundwater in 2020, by a total of 147 million gallons per day, and will have to find alternative sources. (Poertner)

COST OF DOMESTIC WELLS AND WATER TREATMENT IN ILLINOIS,
Illinois State Water Survey, Urbana.
James P. Gibbs.
Illinois Department of Registration and Education, Springfield, Circular 104, 1971. 23 p, 11 fig, 4 ref.

Descriptors: *Water costs, *Costs analysis, *Water supply, *Water management (Applied), *Water wells, Wells, Domestic water, Water purification, Pumping, Shallow wells, Aquifers, Illinois, Groundwater mining, Groundwater.
Identifiers: *Domestic well costs, *Water treatment costs.

Cost information is given for private residential groundwater supply systems in Illinois. Graphs can be used to make reasonably accurate cost predictions for different types and depths of water supply wells. A typical domestic well in Illinois may be expected to cost about $575. Cost data for pumping systems equipped with 10-gpm submersible pumps show that the average cost of these systems is about $585. The costs of treating water for domestic use also are summarized. Two graphs illustrate the monthly costs of softening and removing iron at varying monthly consumption rates and concentrations of hardness-forming minerals and iron. The monthly cost of continuous chlorination is calculated. Use of the data presented makes it possible to estimate the monthly costs of raw and treated water from a domestic groundwater supply. Two maps show the probable costs of domestic raw water supply systems from sand and gravel wells and bedrock wells throughout the state. For a typical installation and domestic use rate in Illinois, the monthly cost of raw water is about $11.00, softened water $15.40, softened treated for iron $22.00, and softened water treated for iron and chlorinated $25.00. Similar calculations for any type and depth of well, water quality, and treatment can be made from the information in this report. This material should provide adequate information for planning purposes and decision making in developing a desired domestic supply. (Poertner)

EVALUATION AND COMPARISON OF RED FORK SAND WATERFLOOD PROJECTS IN OKLAHOMA,
Bureau of Mines, Washington, D.C.
Kenneth H. Johnston.

Available from the National Technical Information Service as PB-197 105, $3.00 in paper copy, $0.95 in microfiche. Bureau of Mines Report of Investigations 7465, 1970. 45 p.

Descriptors: *Injection wells, *Oil industry, *Oil reservoirs, Oklahoma, *Sandstones, Permeability, Porosity.
Identifiers: *Oil recovery, *Water injection, Drill core analysis, Well completion fluids, Red Fork Sand, *Low permeability sandstone reservoirs.

Information on oil and water production, volume of water injected, core analyses, and well completion data was collected on 28 Red Fork sand waterflood projects for comparison and evaluation of results. An average water injection efficiency of 35 percent, an average water-injected to oil-produced ratio of 16.8:1, and an average loss outside the flood pattern of approximately 45 percent of the injected fluid resulted in an oil recovery to January 1, 1969, of only 5.6 percent of the pore volume, or 9.1 percent of the initial stock-tank oil in place. The principle causes of poor oil recovery from these projects are the losses of large quantities of injection water from the flood patterns through oriented, natural fracture systems or zones of high permeability and excessive channeling of injection fluids from input wells to oil wells. For more efficient operation and a higher percentage of oil recovery from the Red Fork sand and other low-permeability-sand waterflood projects, directional orientation of both induced- and natural-fracture systems should be determined during early development. The success of a low-permeability-sand waterflood project depends to a large extent upon the orientation of the injection wells with the fracture system.

ELECTRIC ANALOG MODEL STUDY OF THE HYDROLOGY OF THE SAGINAW FORMATION IN THE LANSING, MICHIGAN AREA--1963,
Michigan State Univ., Lansing. Dept. of Geology.
Merlin L. Wheeler.
Available from the National Technical Information Service as PB-199 538, $3.00 in paper copy, $0.95 in microfiche. Technical Report No 10, Institute of Water Research, Michigan State University, Dec 1970. 63 p, 24 fig, 4 tab, 5 ref. OWRR Project A-001-MICH (3).

Descriptors: *Analog models, *Groundwater movement, *Hydrologic properties, *Water supply, *Leakage, Piezometry, Data, Pumping.
Identifiers: Steady-state analysis, Transient analysis, Saginaw formation.

An electric analog model was constructed to deal with the problem of groundwater withdrawal by many centralized supply systems from the Saginaw Formation, the primary source of water for domestic and industrial use in the Lansing, Michigan area, which has resulted in a large cone of depression which is expanding rapidly. The initial design of the model utilized data presently available. In order to determine the leakage rate, a steady-state, or equilibrium analysis of the model was initiated using actual conditions, thus eliminating all time-dependent variables from the hydrologic system. The model was then modified for transient analysis until the analog simulation of the decline in the piezometric surface for several periods agreed closely with actual declines. It was also necessary to make a detailed examination of the pumpage from the aquifer. Determination of the leakage that was occurring from the glacial drift, in units of gallons per day square mill per foot of head difference was also made. During the analysis of the model, significant facts were revealed about the hydrology of the Saginaw Formation, most specifically related to aquifer leakage, and was considered a predictive tool in the planning of future water resources development in the Lansing area. (Kriss-Cornell)

4C. Effects on Water of Man's Non-Water Activities

URBAN RUNOFF BY ROAD RESEARCH LABORATORY METHOD (DISCUSSION),
Leonard H. Watkins, Franklin F. Snyder, Harvey W. Duff, and George C. C. Hsieh.
J Hydraulics Div, Am Soc Civil Engrs, Vol 96, No HY7, p 1625-1631, Jul 1970. 2 tab, 4 ref.

Descriptors: *Hydrographs, *Runoff coefficient, Evaluation, Runoff, Rational formula, Storm runoff.
Identifiers: *RRL method, *Urban runoff.

The authors separately discuss aspects of the article included in a previous issue on an application of the Road Research Laboratory method (RRL) for synthesizing urban runoff hydrographs to conditions at three locations in the United States. Leonard Watkins describes the use of this method in Great Britain, concluding that the amounts of runoff found by the American authors agreed with experience in Great Britain. Frank Snyder discusses the theoretical applicability and other features of the RRL method, and he concludes that more analysis is needed in regard to the assumption of a constant runoff coefficient equal to the percentage of impervious area connected to a storm drainage system. He also states that the applicability of the RRL method to urban basins with pervious and unconnected impervious areas for infrequent design storms is limited. Harvey Duff and George Hsieh compare the commonly-used rational method to the RRL method for predicting urban runoff. The RRL method seems to result in more accurate inflow predictions, but both methods predict runoff accurately. The rational method appears easier to use; and when the RRL method is tried, a shorter time increment is recommended. (See also W70-02467)
W71-07841

URBAN RUNOFF BY ROAD RESEARCH LABORATORY METHOD (DISCUSSION),
D. Earl Jones.
J Hydraulics Div, Am Soc Civil Engrs, Vol 96, No HY9, p 1879-1880, Sept 1970.

Descriptors: *Runoff forecasting, *Hydrographs, Methodology.
Identifiers: *RRL method.

The writer states that the Road Research Laboratory method provides a basis for evaluation of potential drainage area responses without prior extensive collection of local urban streamflow records furnishing a simple rationale for estimating flow hydrographs. The RRL model seems advantageous from the standpoints of simplicity, ease of application, minimal data input requirements, and reasonable reliability of results in the common application range. INVESTIGATION OF A WATER SUPPLY NEAR ENCINO, NEW MEXICO, DURING THE STARMET TEST,
Geological Survey, Albuquerque, N. Mex.
J. A. Basler.
Geological Survey Open-file Report, Mar 1971. 15 p, 2 fig, 3 ref.

Descriptors: *Water levels, *Farm ponds, *Explosions, *New Mexico, Stock water, Surface waters, Testing, Water level fluctuations, Precipitation (Atmospheric), Instrumentation, Evaporation, Consumptive use, Data collections, Evaluation.
Identifiers: *Torrance County (N Mex).

The U. S. Air Force has made tests using conv
tional explosives at a site near Encino, Torra
County, New Mexico. The initial high-ene
detonation test was made at the site on Oct
1968. Soon thereafter, the ranch owner expres
concern that the detonation may have adversely
fected a nearby surface-water supply of two po
used for watering stock, about 250 feet south of
test site. Measurements made immediately bef
and after a detonation test, Nov. 4, 1970, indic
that the water levels in the ponds were not affec
by the detonation. The water-level declines
served during a period of several days after
detonation are regular in occurrence and
similar to declines observed for several days p
to the detonation. These declines are attributed
water losses caused by evaporation and st
watering. The relation of the volume of water in
ponds to gains from precipitation, and losses fr
evaporation and from stock watering supports
conclusion, indicated by water-level measu
ments, that the detonation caused no change in
water supply in the ponds. (Woodard-USGS)

D AND COD ANALYSES ON PARAFFINIC DROCARBONS,
versity of Western Ontario, London. Biochemi- Engineering Group.
ajic, O. Spacek, and V. Strizic.
rnal, American Water Works Association, Vol No 12, p 784-786, Dec 1970.

criptors: *Biochemical oxygen demand, emical oxygen demand, *Analytical niques, Kinetics, Design criteria, Mixing, Tem- ature, Oxidation, Incubation.
Identifiers: *Standard methods, *Manometric techniques, Hydrocarbons, Theoretical oxygen demand, BOD 5.

BOD and COD analyses on paraffinic hydrocarbons have long given erroneous results because of separation of the oils from the sample, and the subsequent incomplete oxidation. Hydrocarbons analyzed, including n-Hexane, n-Heptane, n-Decane, n-Dodecane, n-Hexadecane, n-Heptadecane, by the APHA standard BOD and COD analyses yielded values for COD of less than 5.5% of the Theoretical Oxygen Demand (TOD), of the amount of oxygen need to completely oxidize each hydrocarbon to CO2 and H2O. For BOD, the highest analysis was 2.2% of the TOD. Strict observance of the following precautions is required for BOD analyses on straight chain hydrocarbons: (1) pipettes must be chemically clean, and constructed such that oil will not stick to the surface, (2) oils present must not be allowed to separate from aqueous phase; (3) continuous stirring of the BOD bottle during the 5-day test should be practiced if at all possible. The Standard Methods 5-day BOD test has validity for hydrocarbon wastes only if these precautions are strictly observed. At the present time, COD analyses cannot be applied to hydrocarbon wastes, and COD data should be discarded in favor of BOD data obtained in the prescribed manner. (Lowry-Texas)

DEVELOPMENT OF INSTRUMENTAL TECHNIQUES FOR THE ANALYSIS OF TRACE ORGANIC CONSTITUENTS IN WATER,
Connecticut Univ., Storrs.
Ralph P. Collins.
Completion Report, July 15, 1970. 3 p. OWRR Project A-022-CONN (2).

Descriptors: *Gas chromatography, *Analytical techniques, Chromotography, Infrared, Mass spectrometry, *Freeze drying.
Identifiers: Geosmin, Trace organic constituents, *Streptomyces odorifer.

This project was concerned with the development of effective means of isolating, concentrating, identifying, and automating measurements of trace organic constituents in public water supplies. The trace organic constituents were removed from aqueous solution by freeze drying. This procedure avoids chemical, biological, or physical transformations which are inherent in most other methods. The concentrated material is extracted in a liquid-liquid extractor for approximately 72 hours. The petroleum-ether extract is dried, carefully, concentrated, and the concentrated extract is then subjected to gas-liquid chromatography. Infrared spectra and moss spectra were also obtained. Utilizing the procedure developed, earthy-musty odor constituents produced by Streptomyces odorifer were identified; these are trans-1, 10-dimethyl-trans-9-decalol (geosmin) and 2-exo-hydroxy-2-methylbornane. A third important earthy-musty odor compound has not as yet been identified.

SPECTROPHOMETRIC DETERMINATION OF SMALL QUANTITIES OF PHENOLS, (IN RUSSIAN),
Moscow State Univ. (USSR).
A. P. Terentiev, S. I. Obtemperanskaya, and Yu. N. Tikhonov.
English summary. Zhurnal Analiticheskoi Khimii, Vol 25, No 9, p 1815-1818, 1967. 1 fig, 1 tab, 11 ref.

Descriptors: *Oxides, *Phenols, *Spectrophometry, Colorimetry, Analysis, Analytical techniques.
Identifiers: Naphthals, Heterocyclic oxy-compounds.

The introduced spectrophotometric method of determination of oxy-groups in phenols, naphthols and some heterocyclic oxy-compounds is based on the colorimetric reaction of Janovsky. Essentially, the analysis consists of an extraction of 2-4 dinitrophenyl ethers with benzol and addition of acetone and tetramethyl ammonium hydroxide. The dependability of the method was verified by analyses of 26 phenols, including some pharmaceutical compounds. Positive results were not obtained with phenols vulnerable to quinone formations and phenols containing strong electron accepting groups or dinitro-derivatives insufficiently soluble in organic solvents. STREAM POLLUTION EXAMINATION BY BIOLOGICAL TESTS,
Vysoka Skola Chemicko-Technologicka, Prague (Czechoslovakia).
Dragica Matulova.
Preprint, Fourth International Conference on Water Pollution Research. Prague, Section 3, Paper 2, p 1-11, 2-6 Sept 196h 5 fig, 1 tab, 22 ref.

Descriptors: *Water pollution examination, *Biological tests, *Streams, Experimental procedures, Bioassay, Toxicity.
Identifiers: *A-Z procedure, *Chlamydomonas, *The Biomass Titre (BMT).

Biological methods for classifying different water pollution levels in streams can be divided into ecological and physiological techniques. The physiological methods, which also include methods for estimation of the toxicity, utilize two main procedures, namely: (1) the exposure of natural populations living in the water under examination, in the same water or in different dilutions of toxic substances; and (2) the exposure of suitable test organisms in the water under examination after removal of the original population. Three methods were described: the A-Z procedure, the biomass titre (BMT), and bioassay with Chlamydomonas. The advantages and disadvantages of each were discussed. (Wahtola-Washington)

CONCENTRATION OF STRONTIUM-85 AND CESIUM-137 FROM WATER SOLUTIONS BY CLADOPHORA AND PITHOPHORA,
Alabama Univ., University. Dept. of Biology.
Louis G. Williams.
Journal of Phycology, Vol 6, No 3, p 314-316, 1970. 1 tab, 4 ref.

Descriptors: *Radioisotopes, *Algae, *Absorption, Monitoring, Analytical techniques, Laboratory tests, Cesium, Strontium radioisotopes, Ions, Rivers, Cultures, Organic matter, Bacteria, Water analysis.
Identifiers: *Cladophora glomerata, *Pithophora oedogonia.

With the use of packaged live and preserved green algae and other organic materials, radionuclides in natural waterways, not found by the usual methods of analysis of raw water can be detected. Live algae concentrate cesium and strontium ions much more than ion-exchange resins or dead materials. This is significant in the ecology of food webs where radionuclides may be passed on to higher trophic levels. The concentration factors of nonliving organic materials were much lower and varied with the material, not with the calcium/potassium ratio. The effect of high calcium ions and high potassium ions was to lower the uptake of cesium more than strontium. Cladophora and Pithophora were grown in aquaria, packaged live in perforated polyethylene bags and tied submerged in various rivers for periods of 2 to 7 days, after which the contents showed high concentrations of many fission products, including strontium and cesium. Where aquatic environments are unfavorable for live Pithophora or Cladophora, these algae, fixed with merthiolate-iodine preservative, have been shown to be about twice as effective as mixed ion-exchange resins. (Jones-Wisconsin)

COMPARISON OF TWO STORAGE METHODS FOR THE ANALYSIS OF NITROGEN AND PHOSPHORUS FRACTIONS IN ESTUARINE WATER,
Bureau of Commercial Fisheries, Beaufort, N.C. Center for Estuarine and Menhaden Research.
Gordon W. Thayer.
Available from the National Technical Information Service as COM 71-00206, $3.00 in paper copy, $0.95 in microfiche. Chesapeake Science Vol 1, No 3, p 155-158, Sept 1970. 2 tab, 11 ref.
Identifiers: *Nutrients, Storage, *Water analysis, Nutrients, *Estuaries, Water analysis, Refrigerating, Freezing, Phosphates, Nitrates, Nitrates, Ammonia, Quantitative analysis.

The change, during storage, in concentration of dissolved inorganic, dissolved organic, and particulate phosphorus, and nitrate, nitrite, and ammonia in estuarine water was examined in samples that were refrigerated and in samples which were quick-frozen. One half of each set of samples was pretreated with 0.7% v/v chloroform. At all times of the year quick-freezing alone stabilized nutrient concentrations, whereas freezing with chloroform resulted, at times, in significant changes in the nutrient levels. Refrigeration never stabilized all nutrient levels regardless of the presence or absence of chloroform.

NUTRIENT DATA ON SEDIMENT SAMPLES OF THE POTOMAC ESTUARY, 1966-1968,
Environmental Protection Agency, Annapolis, Md. Water Quality Office.
James W. Marks, and Orterio Villa, Jr.
Chesapeake Technical Support Laboratory Data Report No 11, 1970. 20 p, append.

Descriptors: *Nutrients, *Bottom sediments, *River beds, *Estuaries, *District of Columbia, Virginia, Maryland, Sampling, Methodology, Analysis, Analytical techniques, Phosphorus, Nitrogen, Chemical oxygen demand, Chlorophyll, Data collections, Sediments.
Identifiers: *Potomac estuary, *Potomac river.

During the years of 1966 through 1968 the Chesapeake Technical Support Laboratory, conducted three separate surveys of the bottom sediments of the tidal portion of the Potomac River to determine the existing quality of the river bottom. The results of these investigations are presented and the sampling procedures and analytical methods are described. In 1966 the Potomac River between the 14th Street Bridge in Washington, D.C. to the U.S. Route 301 Bridge near Morgantown, Maryland, was sampled three times, March-May, June-August and September-October. In 1967 the same portion of the river was sampled twice, March-April and again during September. In 1968 the river between the U.S. Route 301 Bridge to the mouth of the river at Point Lookout was sampled once during February. The parameters measured include total phosphorus, inorganic phosphorus, total nitrogen, ammonia nitrogen, chemical oxygen demand, wet weight, dry weight, volatile weight and chlorophyll a. SUMMARY OF ENVIRONMENTAL MONITORING AT AMES LABORATORY, 1962-1969,
Environmental Protection Agency, Rockville, Md. Radiation Office.
J. J. Copp.
Radiological Health Data and Reports, Vol 12, No 3, p 119-128, Mar 1971. 10 p, 3 fig, 10 tab, 7 ref.

Descriptors: *Pollutant identification, Environmental effects, *Radioactive waste, *Monitoring, *Radioactivity effects, Analytical techniques, Iowa, Surface waters, Groundwater, Soils, Vegetation, Atmosphere, Sediments, Radiation, Sampling, Data collections.
Identifiers: *Environmental pollution, *Ames Laboratory Research Reactor facility, Iowa State University.

The Ames Laboratory Research Reactor facility (ALRR), operated for the U.S. Atomic Energy Commission by the Iowa State University of Science and Technology, reached full power in July 1965. The preoperational and present environmental monitoring program consists of gross alpha and gross beta radioactivity determinations in air, soil, vegetation, river water, ALRR outfall, river bottom sediment, precipitation, well water, and pond water samples. River water samples are collected weekly and analyzed for gross alpha and gross beta radioactivity. One-liter samples are filtered and counted separately as suspended and dissolved solids. Yearly averages for gross beta radioactivity in suspended and dissolved solids in river water samples for each sampling site from 1963 to 19 are tabulated. The environmental sampling p gram is maintained to provide information rega ing the effectiveness of control measures and determine whether any radiological changes in environment are the result of laboratory ope tions. ON THE BALANCES OF Sr-90 AND Cs-137 THE BALTIC SEA,
Institute of Marine Research, Helsinki (Finlan and Institute of Radiation Physics, Helsinki (F land).
Aarno Voipio, and Anneli Salo.
Nordic Hydrology, Vol 2, No 1, p 57-63, 1971. 2 fig, 1 tab, 15 ref.

Descriptors: *Fallout, *Strontium radioisotop *Cesium, *Sea water, Surveys, Geochemis Water chemistry, Path of pollutants, Wa balance, Radioisotopes, Radiochemical analy Distribution patterns.
Identifiers: *Finland, *Baltic Sea.

The total amounts of Sr-90 and Cs-137 that ac mulated in the water of the Baltic Sea in the ye 1960-67 are estimated on the basis of 10-15 sa ples collected annually. There are no signific sources of the radionuclides in the area other t atmospheric deposition on land and sea surfa The amounts of nuclides transported by the c flow through the Danish Sounds were evalua from the nuclide concentrations found in the s face waters of the southern Baltic and the Dan Sounds, and the mean outflow. The estima balance of strontium-90 based on the present d is in accordance with the known fact that the str tium concentration is a conservative property sea water. The estimate does not indicate any re removal of cesium-137 from Baltic Sea water geochemical or biological processes. (Kna USGS)

WATER QUALITY EVALUATION OF T MIDDLE RIVER ROUGE BASIN.
Michigan Water Resources Commission, Lans Dept. of Conservation.

Michigan Water Resources Commission, Dep ment of Conservation, Lansing, Oct 1967. 59 p, fig, 14 tab, 11 ref.

Descriptors: *Water quality, *Water pollution c trol, *Water pollution effects, *Waters management, *On-site investigations, Erosion c trol, Michigan, Impaired water quality, Water an ysis, Water quality control, Water quality Michigan.
Identifiers: *Middle River Rouge (Mich), Wa County (Mich).

The water quality of flows in the Middle Ri Rouge was studied, based upon water samples c lected at 18 locations on the river. The Ri Rouge basin is located in the southeastern port of Michigan's Lower Peninsula, principally Wayne County. The area drained by the Mid River Rouge is approximately 117 square miles was found that the water quality of the Mid River Rouge, particularly in its lower reaches seriously degraded. Indications of this degradat are: low dissolved oxygen concentration; high c centrations of oxygen demanding 5-day BOD s stances, inorganic nutrients, coliform bacteria, visible films of oil. The causes of water qua degradation include combined sewer diversi trash accumulation, industrial waste discharge soil erosion. Heavy use is made of the river and jacent land areas. Recreational uses are of pr importance. These uses will probably increase the future and a higher quality of water will required to meet the standards set for these u The report includes descriptions of Basin char teristics, developments within the Basin, causes water quality deterioration and implicati

reof, and suggestions for correcting the causes vater quality deterioration. The corrective mea- es suggested include: providing incentives to tractors to adopt practices that minimize soil sion; encouraging municipalities to treat waste er and reduce combined sewer overflows; inate improperly treated and untreated indus- l waste water discharges; and preventing trash umulations that contribute to stream con- ination. cern arises for bathing hazards in seawater con- inated by viable bacteria from sewage harges into the sea. Seawater is, however, lethal oliform bacteria but causes for this are insuffi- tly known. Two methods are presented for field rmination of bacterial disappearance in sea- er with an inaccuracy of less than 10 per cent. method consists of a continuous conservative er release into the sewage outflow with simul- eous sampling for bacterial counting and moni- ng of dilution. A case study of Gentofte in The nd between Denmark and Sweden is presented g this first method. The second method of rmining bacterial disappearance consists of an antaneous tracer release into the sewage out- and measurements taken whereby the disap- rance rate equals the ratio between tracer dis- appearance and bacterial disappearance from the surface layer. A case study of Manila Bay is presented using this second method. In both methods the rate of disappearance is defined on the basis of continuity--the ratio between the bacterial flux as measured and the bacterial flux as would have been if no disappearance were taking place. SANITARY-BIOLOGICAL INVESTIGATIONS OF COASTAL SEA WATER AROUND NORTH SEA ISLAND OF SYLT (IN GERMAN),
Kiel Univ. (West Germany). Institut fuer Biokli- matologie und Meeresheilkunde.
J. Peters.
Helgolaender Wissenschaftliche Meeresunter- suchungen, Vol 21, No 3, p 310-319, Dec 1970. 1 fig, 2 tab, 12 ref.

Descriptors: *Sewage bacteria, *Beaches, *Public health, *Pathogenic bacteria, On-site investiga- tions, Sewage effluents, Water pollution, Human pathology, Coliforms, Oceans, Bacteria, Data col- lections, *Pollutant identification.
Identifiers: *Island of Sylt, *North Sea, Germany.

The island of Sylt is an important German recrea- tion center in the southern North Sea. The sewage from the island's villages is emptied directly into the sea waters between the island and the German coast. A study was made in 1967 and 1968 to deter- mine if sewage pollution occurred at the beaches of Sylt's open sea coast. Chemical qualities, a general bacterial count, and coli-titre of 225 water samples were taken around the island to determine the water quality for bathing. Results showed that ex- cept for narrow areas left and right of the sewage outlets of the four sewage plants, the upper limit of bacterial number and of the coli-titre was not reached. Coli-titre comparisons revealed a tidal drift of sewage-contaminated waters from the 'Wattenmeer' coast to the open sea beach. While the general number of bacteria depends on organic matter concentration, the absolute number of sewage bacteria can be estimated only by the coli- titre. A continual check of the pathogenic sewage bacteria, Bacterium coli and the coliform bacteria, in the sea water is necessary for public health. (Mc Entyre-PAI)

NUTRIENT SUPPLY AND PRIMARY PRODUCTION IN CLEAR LAKE, EASTERN ONTARIO,
Trent Univ., Peterborough (Ontario).
D. W. Schindler, and J. E. Nighswander.
Journal Fisheries Research Board of Canada, Vol 27, No 11, p 2009-2036, 1970. 16 fig, 11 tab, 57 ref.

Descriptors: *Precipitation (Atmospheric), *Nutrients, *Primary productivity, *Phytoplank- ton, Productivity, Oligotrophy, Standing crop, Chemical properties, Water pollution sources, Nitrogen, Phosphorus, Eutrophication, Calcium, Ions, Magnesium, Fertility, Watershed manage- ment, Lakes, Limnology, Evapotranspiration, Run- off, Chrysophyta, Cyanophyta, Pyrrophyta.
Identifiers: *Clear Lake (Ontario), *Canadian Shield, Morphometric features.

Phytoplankton production in a small Canadian Shield Lake, largely uninfluenced by humans, was studied in relation to physical, chemical, and geological factors. Primary production is extremely high for a lake with low phytoplankton standing crop and nutrient supply and production is not reflected in the chemical regimes normally used as indicators of lake metabolism. Production during the ice-free season ranged from 0.10 to 2.57 grams carbon/sq m per day and averaged 250 grams car- bon/sq m per year for the lake as a whole. Lim- nologically, Clear Lake is a typical oligotrophic lake. The high production values are partially ex- plained by the high correction for filtration error which averaged 3.2 times for all occasions tested. Since the Clear Lake system has no inlet streams from other lakes, a single discrete outlet, and little or no groundwater flow, a nutrient 'loading rate' could be calculated. Vegetation is lush probably reflecting higher annual precipitation in the area. Major source of supply of the nutrients, nitrogen and phosphorus, and calcium and magnesium, is at- mospheric precipitation. Sodium potassium, and silica apparently enter from terrestrial watershed. CONCENTRATIONS OF POLLUTANTS IN AGRICULTURAL RUNOFF,
Texas Tech. Univ., Lubbock. Dept. of Civil Engineering; and Texas Tech. Univ., Lubbock. Dept. of Chemistry.
Dan M. Wells, Ellis W. Huddleston, and Robert G. Rekers.
Partially supported by FWQA. Water Resources Bulletin, Vol 7, No 1, p 124-132, Feb 1971. 9 p, 3 tab.

Descriptors: *Lakes, *Water quality, *Texas, *Farm wastes, *Water pollution sources, Runoff, Nutrients, Solutes, Nitrates, Phosphates, Herbicides, Pesticides, Playas, Overland flow.
Identifiers: Agricultural runoff.

Eighteen rural lakes in Lubbock County, Texas, were sampled on a routine basis following runoff-producing rainfall for a period of approximately eighteen months to determine whether or not runoff from intensively farmed agricultural areas contained significant concentrations of nitrates, phosphates, herbicides, or insecticides. An additional fifteen lakes lying within a triangle bounded by the cities of Plainview, Canyon, and Hereford, Texas, were sampled one time during the summer of 1969 to provide additional data regarding the nature and extent of the potential problem in an area with a different soil type and a slightly different cropping pattern. Based on results of detailed analyses of approximately two hundred samples of water collected from the lakes and an equal number of sediment samples collected from the same lakes at the same time, it appears that the concentrations of all chemical pollutants in runoff from agricultural lands in the High Plains are well below the allowable concentrations for drinking water. P. G. W. Jones, and A. R. Folkard.
Journal of the Marine Biological Association of the United Kingdom, Vol 51, No 1, p 159-182, Feb 1971. 24 p, 10 fig, 3 tab, 20 ref.

Descriptors: *Path of pollutants, *Nutrients, *Phosphates, *Nitrates, *Sea water, Industrial wastes, Runoff, Farm wastes, Productivity, Fish, Fisheries, Hydrography, Oceanography, Salinity, Water analysis.
Identifiers: *Irish Sea.

A series of surveys investigating the distribution o nutrient salts in the eastern Irish Sea was mad between May 1965 and April 1968, concentrati on the winter and early summer period. During th winter, the greatest concentration of nutrient sal occurred in the low-salinity inshore water. Plan ton production considerably modified the distrib tion of nutrient salts during the summer, maskin the relationship with salinity. An area of very hig phosphate values was found off St. Bees Head ar was traced to effluent from a nearby chemic works. The distribution of one nutrient salt ratio another was studied during the winter survey. Th N:P and Si:P ratios were related to salinity an hence to the degree of terrestrial runoff. The N: ratio did not conform to this pattern. The curre systems of the area may be subject to variation. (K napp-USGS)

A STUDY ON CHANGES IN QUALITY OF UN DERGROUND WATER,
Tabela House, Kota (India). Agricultural Chemi try Section.
B. L. Darra, Harvinder Singh, and R. S. Mendirat
Journal of Soil and Water Conservation in Indi Vol 18, Nos 1 and 2, p 1-3, Jan-June 1970. 3 p, tab, 6 ref.

Descriptors: *Water quality, *Return flo *Groundwater, *Saturated soils, *Irrigation e fects, Leaching, Water level fluctuations, Salin soils, Land reclamation, Path of Pollutants.
Identifiers: *India.

Underground well waters were collected in pre an post seasons to assess the changes brought about quality of waters in the two irrigation seasons und saline and saline-alkali water logged areas of Bun district of Chambal command, India. The quality water slightly improved after rains, while in anoth part it was slightly impaired. The canal water is good quality. Efforts are in progress to decrease th salt contents of the surface by leaching and flushi aided by lowering the water table using surfa drainage facilities. Simultaneously other soil rec mation measures have also been undertaken boost crop production. (Knapp-USGS)

NITRATE AND OTHER WATER POLLUTANTS UNDER FIELDS AND FEEDLOTS,
Agricultural Research Service, Fort Collins, Colo. Soil and Water Conservation Research Div.
B. A. Stewart, F. G. Viets, Jr., G. L. Hutchinson, and W. D. Kemper.
Environmental Science and Technology, Vol 1, No 9, p 736-739, 1967. 2 fig, 1 tab, 1 ref.

Descriptors: *Nitrates, *Water pollution sources, Leaching, Farm wastes, Groundwater, Hydraulic conductivity.
Identifiers: Organic carbon, Feedlots.

Agriculture's effect on nitrate pollution of groundwater was investigated in the South Platte valley of Colorado. The valley is intensively farmed and contains many concentrated livestock feeding operations. A water table, generally between 3 and 20 meters below the surface, underlies much of the area. The average total nitrate-nitrogen to a depth of 6.7 meters in the profiles for the various kinds of land use was: alfalfa (Medicago sativa) (13 cores), 70; native grassland (17 cores), 81; cultivated dryland (21 cores), 233; irrigated fields not in alfalfa (28 cores), 452; and feedlots (47 cores), 1282 kg. per hectare. Groundwater samples often contained high concentrations of nitrate, and those obtained beneath feedlots contained ammonium-nitrogen and organic carbon. Data presented show that nitrate is moving through the soil and into the groundwater supply under both feedlots and irrigated fields in crops, excluding alfalfa. (Parker-Iowa State)

ELECTRIC POWER AND THERMAL DISCHARGES; THERMAL CONSIDERATIONS IN THE PRODUCTION OF ELECTRIC POWER.

Merril Eisenbud and George Gleason, (eds). New York, Gordon and Breach, 1971. 423 p.

Descriptors: *Thermal powerplants, *Thermal pollution, *Electric power demand, *Environmental effects, *Water quality control, *Heated water, *Temperature, *Regulations, *Cooling, Conservation, Beneficial use, Cooling water, Evaporation, Convection, Radiation, Design criteria, Rivers, Estuaries, Mixing, Condensers.
Identifiers: *Cooling systems, *Waste heat utilization, *Waste heat dissipation.

The purpose of the symposium was to bring together experts from industry, the universities and laboratories, and the government to assess the state of our knowledge of the environmental impact of heated discharges from thermal powerplants. The general topics covered include the description of the relationship between electric power and the environment; projected demand for electric power and thermal output; the effects of temperature variations on the aquatic ecosystems; the scientific rationale for federal and state water quality standards; the impact of environmental considerations on the design and operation of power facilities; the technological alternatives for minimizing waste heat rejection; and, the beneficial utilization of waste heat. THE POWER INDUSTRY AND THE ENVIRONMENT,
Public Service Co. of New Hampshire, Manchester.
William C. Tallman.
In: Electric Power and Thermal Discharges; Thermal Considerations in the Production of Electric Power. Gordon and Breach, New York, 1971, p 1-5.

Descriptors: *Electric power demand, *Electric power industry, *Environmental effects, *Thermal powerplants, Thermal pollution.
Identifiers: Electric Power Council on Environment.

The paper presents the basic objectives of the Electric Power Council on Environment established in September, 1969: (1) to promote and coordinate electric utility programs in the environment field, (2) to encourage communication between the electric power industry and all others concerned with the environment, and (3) to stimulate research and to make recommendation in regard to environmental considerations. In the discussion of electric power and the environment, the author points out that the electric energy component is now about 20-25% of the total and is growing at a rate about 2 1/2 times faster than is the total use of energy. It is expected that by the year 2000 electric energy will represent about 50% of all energy utilized. (See also W71-08298) (Oleszkiewicz-Vanderbilt)

THE POWER ENVIRONMENT OF THE 1970'S,
Department of Water and Power, Los Angeles, Calif.
Floyd L. Goss.
In: Electric Power and Thermal Discharges; Thermal Considerations in the Production of Electric Power. Gordon and Breach, New York, 1971, p 7-19.

Descriptors: *Electric power demand, *Electric power industry, *Thermal powerplants, *Environmental effects, *Thermal pollution.
Identifiers: National Electric Reliability Council.

After presentation of the status and activities of the recently formed National Electric Reliability Council (NERC), the author states that by 1980 new generating capacity will be installed at a rate of 46,000 Mw per year, which is expected to increase to 66,000 by 1985. Bearing in mind the beneficial effects of installed capability, the author points out that many of the proposed restrictions on the environment are based on mere supposition. Some results of actual operating experience can differ radically from theoretical predictions: (1) both king salmon, striped bass and opossum shrimp can be passed through the operating condensers of a power plant with a high survival rate; (2) the temperature increase imposed by thermal discharges in tide waters does not cause changes in the DO content of the water; (3) natural temperature flutuations in Californian bays and open ocean may vary greatly and considerably exceed those resulting from the thermal power plant's discharges. ELECTRIC POWER AND THERMAL OUTPUT IN THE NEXT TWO DECADES,
Federal Power Commission, Washington, D.C.
F. H. Warren.
In: Electric Power and Thermal Discharges; Thermal Considerations in the Production of Electric Power. Gordon and Breach, New York, 1971, p 21-46. 2 fig, 7 tab.

Descriptors: *Electric power demand, *Thermal power plants, *Environmental effects, *Thermal pollution, *Cooling towers, Cooling water.
Identifiers: Federal Power Commission, *Waste heat, Cooling ponds.

Estimates of potential waste heat output and related cooling needs in six basic regions of the United States are presented. Four methods of cooling have been considered in the periods 1971-1980 and 1981-1990: fresh water once-through cooling; fresh water cooling ponds; fresh water evaporative cooling towers; and once-through cooling using saline water. Detailed analysis of presented data is followed by the conclusions that continual assessment of the benefit-to-cost ratio will provide the best guide for decisions in critical judgment cases.

The high ratio of waste heat to useful electrical energy generated emphasizes the need to press every possible means of improving the efficiency of present generating systems. (See also W71-08298) (Oleszkiewicz-Vanderbilt)

THE USE OF RIVER MODELS IN POWER PLANT HEAT EFFECT STUDIES,
Worcester Polytechnic Inst., Mass. Alden Research Labs.
Lawrence C. Neale.
In: Electric Power and Thermal Discharges; Thermal Considerations in the Production of Electric Power. Gordon and Breach, New York, p 381-416, 1971. 14 fig, 3 photos.

Descriptors: *Model studies, *Thermal powerplants, *Temperature, *Test procedures, Instrumentation, Froude Number, Reynolds number, Isotherms, Rivers, Estuaries, Reservoirs.
Identifiers: *Distorted models, Temperature sensors.

A number of river model studies have been undertaken at the Alden Research Laboratories to determine the influence of heated water effluents on bodies of water. The flow patterns developed from these model studies have been used to predict the flow patterns and temperature patterns in the prototype. Although it is difficult to obtain detailed data from the field after completion of projects, the results that have been obtained indicate good agreement with those of the distorted model study. Receiving water temperature ranged from 32F and temperature differentials produced by condenser cooling have varied from 0 deg to 45F. (See also W71-08298) (Oleszkiewicz-Vanderbilt)

fects, *Toxicity, Aquatic animals, Copper, Co
Fish toxins, Water pollution effects, Carp, Bi
say, Laboratory tests, Fish farming, Fish physi
gy, Competition, Ions, Ion transport.
Identifiers: *EDTA, Mercury, Nickle, Comple
agents, Antagonism, TLm.

The effects of complexing agents on toxicit
heavy metal ions to aquatic animals were
vestigated. The authors found that soc
thiosulfate and sodium citrate consider
decrease such toxicity. As the degree of
decreases agreed with the stability constant
heavy metal complexes formed, it was assumed
the decreases might be caused by the low tox
of heavy metal complexes. The acute toxicity o
heavy metal-EDTA complexes, however,
about the same without reference to the toxici
each heavy metal ion. It was felt, therefore,
toxicity might be attributable to EDTA. Carp
successfully reared in a concentration of soc
thiosulfate-complexed Cu.... corresponding to
times the TLm of the uncomplexed Cu..... (See

PLANKTON, ZOOBENTHOS, AND BOT- SEDIMENTS AS RELATED TO POLLU- N AND WATER EXCHANGE IN THE OFJORD,
Univ. (Norway). Inst. of Marine Biology.
rik Beyer.
olaender wissenschaftliche Meeresunter- ung, Vol 17, p 496-509, 1968. 7 fig, 1 tab, 28

riptors: *Water pollution effects, *Bottom ents, *Zooplankton, Benthic fauna, Dis- d oxygen, On-site investigations, Bathymetry, Hydrography, Decomposing organic matter, Water quality, On-site data collections.
Identifiers: *Oslofjord, *Oxygen shortage, *Norway, Polychaetes, Bottom coring, Water exchange, Aglantha digitale, Rathkea octopunctata.

Aglantha digitale and Rathkea octopunctata were found in greatest numbers in the most heavily polluted areas, where bottom water and sediment were generally anoxic and azoic. Spionidae, Hesionidae and Nudibranchia thrived in polluted areas when these were not anoxic. The remaining benthos components compared occurred primarily in water of better quality. A consistent and distinct ranking order was found for all these components. In areas where no bottom fauna was found, and in transitional zones, black or dark layers in the sediment indicated various degrees of oxygen insufficiency. Most remarkable differences (variations) were recorded in the successive years of the survey. (Sjolseth-Washington)

Identifiers: *Des Moines River (Iowa), Tolerance limits, TLm.

A fishkill on the Des Moines River, Iowa occurred in January, 1968, and was associated with the Des Moines Sewage Treatment Plant bypass outfall. The effluent consisted of organic material and thick, heavy oil. Dissolved oxygen downstram from the outfall was less than 2.0 mg/l, but was 10.0.. mg/l above the outfall. D.O. remained low for 35 days. Channel and flathead catfish, carp, river carpsuckers and numerous minnows were affected. Because the river had been under study previously, the authors were able to use tagging techniques to estimate that 54% of the resident channel catfish had been killed. (LeGore-Washington)

GLENODININE, AN ICHTHYOTOXIC SUBSTANCE PRODUCED BY A DINOFLAGELLATE, PERIDINIUM POLONICUM,
Tokyo Univ. (Japan). Lab. of Marine Biochemistry.
Yoshiro Hashimoto, Tomotoshi Okaichi, Le Dung Dang, and Tamao Noguchi.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 34, No 6, p 528-534, June 1968. 7 fig, 1 tab, 8 ref.

Descriptors: *Fishkill, *Toxins, *Algal poisoning, *Algal toxins, *Phytotoxicity, *Fish diseases, *Fish toxins, Toxicity, Hydrogen ion concentration, Dissolved oxygen, Algae, Phytoplankton, Alkaline water, Alkalinity, Fish farming, Fish food organisms, Fish physiology, Red tide, Organic compounds, Dinoflagellates.
Identifiers: *Peridinium sp., *Glenodinine, Alkaloid toxins, Ibogaalkaloid, Organic toxins.

Mass mortalities associated with phytoplankton blooms sometimes occur in Japanese fish culture operations. The authors opine that this may be the first report identifying the toxic species and its associated toxin. The offender, glenodinine, was isolated from the dinoflagellate, Peridinium polonicum. The toxin is an alkaloid showing some resemblance to ibogaalkaloid, and has the sulfhydryl function in the molecule. Fishkills occurred in the afternoon or evening when dissolved oxygen was high and pH levels of 8.7-9.2 were present. Although mortalities sometimes occurred after blooms rather than concurrently, lethal levels of glenodinine were found in the water during the mortalities. The substance is apparently toxic only in alkaline medium, created by high phytoplanktonic photosynthetic activity. (LeGore-Washington)

NOTES ON AN EXPERIMENT UPON THE EFFECT OF CRUDE OIL ON LIVE CORALS,
Department of Primary Industries, Brisbane (Australia).
E. M. Grant.
Fisheries Notes (New Series): No 1, Sept 1970. 3 p. (from: Fisheries Branch, Dept of Primary Industries, Brisbane, Queensland, Australia).

Descriptors: *Oil, *Oily water, *Water pollution effects, *Coral, Oil wastes, Bioassay, Water pollution, Pollutants, Reefs, Aquatic animals, Aquatic environment, Aquatic habitats, Tidal effects.
Identifiers: *Favia sp., Australia, Monnie crude oil, Crude oil, Oil spills, Prediction.

Two Turban Corals (Favia speciosa) were kept in each of three 15 gal saltwater aquaria. One tank served as a control, and three pints of Moonie crude oil were gently layered on the water surfaces of each of the remaining two tanks. Tidal fluctuations were simulated in one 'polluted' tank by gentle siphoning, permitting contact of oil on the coral for about five minutes each day. Precautions were taken to avoid turbulence. On the eighth day oil was skimmed from the surface, and the experiment was continued for an additional 16 days. No coral deaths or ill effects were noted, and the authors suggest that caution should temper predictions as to oil's effects on marine life. This study is regarded as indicative, not definitive. (LeGore-Washington)

EFFECTS OF DIELDRIN ON GLUTAMIC OXALOACETIC TRANSAMINASE IN POECILIA LATIPINNA,
Rosenstiel School of Marine and Atmospheric Sciences, Miami, Fla.
Charles E. Lane, and Edward D. Scura.
Journal of the Fisheries Research Board of Canada, Vol 27, No 10, p 1869-1871, 1970. 1 fig, 12 ref.
FWPCA Grant No 18050 DRL.

Descriptors: *Dieldrin, *Chlorinated hydrocarbon pesticides, *Pesticide toxicity, *Lethal limit, *Fish physiology, *Fish toxins, *Bioassay, Pesticides, Resistance, Fish diseases, Poisons, Toxicity, Toxins, Enzymes, Pathology, Agricultural watersheds, Gas chromatography, Laboratory tests.
Identifiers: *Poecilia sp., *Sailfin molly, Serum enzymes, Glutamic oxaloacetic transaminase.

Sailfin mollies (Poecilia latipinna) were exposed to 0.003, 0.006 and 0.012 ppm dieldrin in sea water at a flow rate of 266 ml/min. Gas chromatography was used to monitor pesticide levels. Blood samples were drawn into capillary tubes directly from the dorsal aorta, and its serum glutamic oxaloacetic transaminase (SGOT) levels were determined by the method of Karmen as modified by Henry et al. Dieldrin caused rapid and great increases in SGOT levels, apparently by inducing cell damage. Although 0.006 and 0.012 ppm killed most fish by 72 hr, final SGOT levels did not correlate with mortality. Surviving fish exposed to only 0.003 ppm accumulated the highest SGOT levels. Considerable variability in resistance to dieldrin among fish was noted. (LeGore-Washington)

THE MINIMUM OXYGEN REQUIREMENTS OF FIVE SPECIES OF FISH UNDER QUIESCENT CONDITIONS,
Oklahoma State Univ., Stillwater.
Walter R. Whitworth, and William H. Irwin.
Proceedings of the 15th Annual Conference of the Southeastern Association of Game and Fish Comm, 1961, p 226-235. 2 tab, 56 ref. NIH Research Grant No RG 6873.

Descriptors: *Oxygen requirements, *Dissolved oxygen, *Fish physiology, *Fish behavior, Minnows, Shiners, Respiration, Mortality, Fishkill, Bioassay, Water pollution effects.
Identifiers: *Oxygen tension, *Survival, Tolerance, Mosquito fish, Oxygen removal, Lebistes reticulatus, Pimephales promelas, Hybognathus placitus, Notropis girardi, Gambusia affinis.

The minimum oxygen requirements of the following five species of fish were studied under quiescent conditions: Lebistes reticulatus, Gambusia affinis, Pimephales promelas, Hybognathus placitus and Notropis girardi. Nitrogen gas was bubbled through the waters in the test vessels to remove the dissolved oxygen. The fish were tested under varied temperatures and at different levels of oxygen depletion. All specimens tested were able to live at oxygen tensions of 1.0 ppm. The reactions of the fish vary with (1) the spread of oxygen removal, and (2) the species. (Sjolseth-Washington)

THE INTERACTIONS OF Cu.... AND CN- WITH PARAQUAT PHYTOTOXICITY TO A CHLORELLA,
Oklahoma State Univ., Stillwater. Dept. of Agronomy.
Sue-Fei Tsay, Jhy-Mei Lee, and J. Q. Lynd.
Weed Science, Vol 18, No 5, p 596-598, 1970. 2 fig, 1 tab, 9 ref.

Descriptors: *Paraquat, *Chlorella, *Phytotoxicity, Herbicides, Copper, Aquatic plants, Test procedures, Toxicity, Chlorophyll, Metabolism, Pesticides.
Identifiers: *Cyanide, *Copper-cyanide interactions.

Cultures of Chlorella pyrenoidosa, IAC 251, were grown in inorganic salt media to near the peak of the log phase of growth and then treated with copper sulfate. Following centrifuging and adjustment of cell density, synchronized cultures were subjected to factorial studies of copper, cyanide, and Paraquat herbicide interaction. The toxicity of the compound to algae resulting from the interaction of copper, cyanide, and 1,1'-dimethyl-4,4'-bipyridinium ion of the herbicide was determined by measuring absorbance of chlorophyll at 434 and 670 millimicrons. Copper inhibited phytotoxicity whereas cyanide accelerated activity of the Paraquat with antagonistic interactions between copper (2 ppm) and cyanide (16 ppm) at Paraquat level of 2 ppm. (Wilde-Wisconsin)

ON RESEARCH OF HUMIC SUBSTANCES IN ESTONIAN LAKES (IN GERMAN),
Akademiya Nauk Estonskoi SSR, Tartu. Inst. of Zoology and Botany.
H. Simm.
English summary. Archiv fur Hydrobiologie, Vol 66, No 3, p 273-282, 1969. 2 fig, 1 tab, 9 ref.

Descriptors: *Eutrophication, *Lakes, *Organic matter, *Humus, Bogs, Humic acids, Forest soils, Color, Marshes, Fulvic acids, Oxygen.
Identifiers: *Estonia (SSR), Humic lakes, Potassium dichromate, Permanganate oxidation.

Water of more than 40% of numerous lakes of Estonian Republic exhibits potassium dichromate consumption over 35 mg/l of oxygen. The high content of organic matter is imparted by drainage areas dotted with muskegs, fens, marshes, and lowland forests. A transition from oligorganic to euorganic waters is marked by an increase in the content of colloidal substances and the intensity of water color. Water of lakes influenced by marshy watersheds is enriched in fulvic acid; lakes located in the proximity of raised bogs have a higher content of humic acid. Enclosed table provides data of seasonal changes in oxidation capacity and color of lakes belonging to different levels of organo-eutrophication. (Wilde-Wisconsin)
W71-07883

VIRUS OCCURRENCE IN RAW SEWAGE SLUDGE AND EFFLUENT OF A BIOLOGICAL CLARIFICATION PLANT (IN GERMAN),
Bundesgesundheitsamt, Berlin (West Germany). Institut fuer Wasser-, Boden-, und Lufthygiene.
S. Carlson.
English abstract. Zentralblatt fur Bakteriologie, Parasitenkunde, Infektion, und Hygiene, Vol 212, No 1, p 50-60, 1969.

Descriptors: *Viruses, *Sewage sludge, *Epidemiology, Public health, Diseases, Water pollution sources, Effluents, Biological treatment, Enteric bacteria, Waste water treatment.
Identifiers: *Entero viruses, *Poliovirus, Berlin (Germany).

The presence of enteroviruses was detected in a volume of raw sewage as small as 0.1 ml in summer and 0.5 ml in winter. Adolescents during the summer appeared to be the maximum of causative agents. A relationship was indicated between outbreaks of epidemics and the virus density in the sewage. Purification of sewage in Imhoff tanks, percolating filters, and secondary sedimentary tanks eliminated only a small percentage of viruses. Tests conducted in an assembly of an oxidation ditch, secondary sedimentation tank, and a tower type percolating filter indicated reduction by approximately one decimal the density of attenuated type I poliovirus. Sewage discharged into water used for drinking or swimming should be subjected to disinfection during the warmer portion of the year. (Wilde-Wisconsin)

THERMOSTABILITY OF LITTORINA MOLLUSKS AS RELATED TO ENVIRONMENTAL CONDITIONS OF DIFFERENT SPECIES (IN RUSSIAN),
Akademiya Nauk SSSR, Vladivostok. Institut Biologii.
A. D. Konev.
Zhurnal Obshchei Biologii, Vol 31, No 3, p 337-341, 1970. 4 fig, 2 tab, 7 ref.

Descriptors: *Mollusks, *Temperature, *Mortality, Resistance, Salinity.
Identifiers: *Thermostability, *Littorina, Amur Bay, Sea of Japan.

Test organisms, including Littorina brevicula, L mandshurica, and L kurila, were subjected to different levels of temperature for ten minutes or longer periods. 50% population mortality was accepted as the criterion of thermostability. The recording of mortality was extended to 15 days following the transfer of the test mollusks into water of 22C and 2.9% salinity. The critical temperature for L mandshurica was 43C and for L brevicula - 46C. The maximum aplitude of thermostability was exhibited by eurybionic species possessing high degree of salinity tolerance. (Wilde-Wisconsin)

RELATION OF THE PHYTOPLANKTON TO TURBULENCE AND NUTRIENT RENEWAL IN CASCO BAY, MAINE,
Woods Hole Oceanographic Institution, Mass.
Edward M. Hulburt, and Nathaniel Corwin.
Journal Fisheries Research Board of Canada, Vo 27, No 11, p 2081-2090, 1970. 4 fig, 4 tab, 30 ref.

Descriptors: *Phytoplankton, *Turbulence *Nutrients, *Distribution, Maine, Diatoms Nitrates, Temperature, Light, Phosphates, Sea water, Bays, Inflow, Currents (Water), Tempora distribution, Spatial distribution.
Identifiers: *Casco Bay (Maine), Thalassiosira nor denskioldii, Chaetoceros socialis, Chaetoceros de bilis, Skeletonema costatum, Leptocylindru minimus, Rhizosolenia delicatula, Guinardia flac cida.

Distributions of phytoplankton and nutrients i Casco Bay (Maine) evidenced by abundance o diatoms from late winter to end of summer, are af fected by the bay's hydrographic features. Nutrien content of the water, particularly nitrate, i depleted during spring by the algal populations ex cept in deep water at bay's entrances. Here ap preciable quantities of nitrate persist into mi summer. Influxes of deep water may carry them in ward and mix them upward, although the chang from spring diatoms, Thalassiosira an Chaetoceros, to Skeletonema is considered to de pend on temperature and light change Phytoplankton extended downward to 30 meters i the bay entrances, but its in situ growth wa restricted to depths closer to the surface due to th turbidity. Its abundance must depend in ear spring on the quantity of nutrients present an renewed from deep water. Both phosphate an nitrate concentrations decreased in surface wate during spring. The continued abundance Skeletonema costatum through summer shows th distinctive effect that enhanced turbulence an concomitant nutrient renewal may have on th flora. This seasonal diatom abundance is importa to filter-feeding animals, for mussles and clam occur between islands. (Jones-Wisconsin)

tifiers: *Seabirds, *Feather wax, *Preening
, *Larodan, Anas sp., Wax.

preen gland wax of several seabirds is com-
d of monoesters of methylated long-chain fatty
hols and fatty acids, but the combinations are
rently species-specific. Complex combinations
mponents are found, e.g. the wax of the com-
mallard (Anas platyrhynchos) may contain up
50 different compounds. Oil impairs water
llancy and heat insulation properties of the
age, and impairs flying and feeding ability. De-
nts remove feather wax, and no seabird can be
ned to its natural environment until waxes are
aced. Larodan 127, a lipid-containing cleaning
t, was used to remove Shell talpa oil 30 from
s. After 8-10 days, swimming ability was
ored, which compares favorably with other
ning agents. (LeGore-Washington)

SOME SUB-LETHAL EFFECTS OF BP 1002 UPON MARINE GASTROPOD MOLLUSCS,
University of Strathclyde, Glasgow (Scotland). Dept. of Biology.
E. J. Perkins.
Journal of the Devon Trust, No 19, p 794-798, Dec 1968. 3 tab, 3 ref.

Descriptors: *Bioassay, *Lethal limit, *Toxicity, *Emulsifiers, *Water pollution effects, *Water pollution treatment, *Growth rates, *Detergents, Toxins, Resistance, Poisons, Gastropods, Mollusks, Snails, Oil, Oil wastes, Oily water, Water pollution sources, Mortality, Pollutants, Treatment, Surfactants.
Identifiers: *PB 1002, *Oil spills, *Oil spill treatment, *Growth inhibition, *Torrey Canyon, TLm, Littorina sp., Nucella sp., Buccinum sp., Concentrations, Dose, Tarsolvent (Petrofina).

PB 1002 is an oil emulsifier, and was used to disperse the Torrey Canyon oil spill in 1967. Short-term TLm values for several organisms against BP 1002 were subsequently determined, but these yield inadequate information. The long-term mortality of animals exposed to BP 1002 and returned to their environment was studied with several gastropods, principally Littorina littorea, L. saxatilis and Nucella lapillus. Mortality was induced by exposure to concentrations considerably lower than the previously determined 24 hr LC50. Growth inhibition of L. littorea was noted at 7.5 ppm, which is 1/400 the 24 hr LC50. Growth inhibition may be indefinitely detected as a result of a single exposure to a pollutant, and such inhibition may require reformation of the definitions of pollution. (LeGore-Washington)

THE EFFECTS OF VARYING CONCENTRATIONS OF NUTRIENTS, CHLORINITY, AND DISSOLVED OXYGEN ON POLYCHAETOUS ANNELIDS,
California State Coll., Long Beach. Dept. of Biology.
Donald J. Reish.
Water Research, Vol 4, p 721-735, 1970. 13 tab, 13 ref.

Descriptors: *Bioassay, *Pollutant identification, *Water pollution effects, *Toxicity, *Environmental sanitation, *Sewage effluents, *Lethal limit, *Annelids, *Bioindicators, Phosphates, Nitrates, Silicates, Chlorine, Dissolved oxygen, Impaired water quality, Pollutants, Water pollution, Indicators, Investigations, Water pollution sources, Toxins, Aquatic environment, Disposal, Treatment facilities, Wastes, Chemical wastes, Inorganic compounds, Fertilizers.
Identifiers: *Polychaetes, Concentrations, TLm, Nereis sp., Neanthes sp., Dorvillea sp., Capitella sp.

The effects of varying concentrations of known environmental variables around marine domestic sewer outfalls were studied on four species of polychaetous annelids which have been employed as indicators of varying degress of marine pollution (Nereis grubei, Neanthes arenaceodentata, Dorvillea articulata and Capitella capitata). The variables included increased concentrations of nitrates, phosphates and silicates, and decreased concentrations of chlorinity and dissolved oxygen. These factors were measured individually, the 3 nutrients together, and all 5 variables together. Data were expressed in the form of 28 day TLm values. N. grubei, the healthy zone indicator, was the most sensitive sp. studied. In general, the tolerances of the two semi-healthy zone indicators and the polluted zone indicator were similar. Comparisons of the TLm values with the concentrations of these factors present at the bubble of the Orange County, California outfall showed that these four species would be unaffected directly by the altered conditions in the waste discharge. (LeGore-Washington)

SPAWNING OF THE AMERICAN OYSTER, CRASSOSTREA VIRGINICA, AT EXTREME PH LEVELS,
Bureau of Commercial Fisheries, Milford, Conn. Biological Lab.
Anthony Calabrese, and Harry C. Davis.
The Veliger, Vol 11, No 3, p 235-237, 1968. 1 fig, 1 tab, 8 ref.

Descriptors: *Oysters, *Hydrogen ion concentration, *Spawning, Aquatic animals, Benthos, Commercial shellfish, Mollusks, Acidity, Alkalinity, Larvae, Bioassay, Laboratory tests, Gametocides, Viability, Connecticut.
Identifiers: *Crassostrea virginica, American oyster, Gametes, Milford (Conn).

Oysters were induced to spawn at various pH levels by use of techniques developed at the Milford laboratory. Successful spawning occurred at pH 6.0 to 10.0. After exposure to test pH levels for varying periods, experimental gametes were mixed with gametes from oysters spawned at normal pH (approximately 7.8). At pH 6.0 and 10.0, gametes lose their viability after 2-4 hr. The viability of oyster gametes spawned at normal pH levels also decreases over time, but the decrease is more abrupt at the extreme pH levels of 6.0 and 10.0. (LeGore-Washington)

STUDIES ON THE TOXICITY OF HEAVY METALS TO AQUATIC ANIMALS AND THE FACTORS TO DECREASE THE TOXICITY--V. A TRIAL TO DECREASE THE TOXICITY OF HEAVY METAL IONS BY THE ADDITION OF COMPLEXING AGENTS (IN JAPANESE),
Universidad Autonoma del Estado de Baja, California (Mexicali).
Kenji Tabata, and Katsuo Nishikawa.
English abstract. Bulletin of Tokai Regional Fisheries Research Laboratory, No 58, p 255-264, May 1969. 1 fig, 4 tab, 10 ref.

Descriptors: *Heavy metals, *Water pollution treatment, *Copper, *Waste treatment, *Sewage treatment, *Chemical precipitation, Toxicity, Water pollution control, Mollusks, Oysters, Bioassay, Ions, Ion transport, Competition, Sodium compounds, Waste disposal, Mining engineering, Chemical wastes, Industrial wastes.
Identifiers: *Mercury, *EDTA, *Complexing agents, Metals, Cations, Precipitates, Green oysters, Sodium citrate, Sodium thiosulfate.

The potential use was studied of complexing agents to decrease toxicity of industrial wastes. They found a remarkable decrease in toxicity when sodium citrate or EDTA was added to copper mine wastes, and when sodium thiosulfate was added to a mercury pesticide. Cu-EDTA is more stable to bacterial decomposition than Cu-citrate. Also, Cu-citrate and Cu-thiosulfate are more readily concentrated by aquatic animals than is Cu-EDTA. This method might be useful as an adjunct to secondary treatment of wastes containing small quantities of toxic heavy metals, but that EDTA is probably too expensive. Such treatment, might be effective in prevention of 'green' oysters. (LeGore-Washington)

STUDIES ON 2-PIPERIDINO-8-MERCAPTOADENINE, A POTENT INHIBITOR OF CLEAVAGE IN ECHINODERM EMBRYOS,
Sloan-Kettering Inst. for Cancer Research, New York; and Mount Desert Island Biological Lab., Salisbury Cove, Me.
C. W. Young, F. J. Hendler, E. Simmel, and D. A. Karnofsky.
Experimental Cell Research, Vol 60, p 45-53, 1970. 4 fig, 4 tab, 10 ref.

Descriptors: *Inhibition, *Inhibitors, *Metabolism, Biochemistry, Chemcontrol, Enzymes, Retardants, Eggs, Embryonic growth stage, Incubation, Competition, Pathology, Fertility, Resistance.

Identifiers: *Cleavage, *Echinoderms, *Mercaptoadenine derivatives, Sand dollar, Development, DNA, PMA, Karyokinesis.

Several 8-mercaptoadenine derivatives inhibited pronuclear fusion, karyokinesis and cleavage in the sand dollar embryo. The most potent of these 2-piperidino-8-mercaptoadenine (PMA) prevented cleavage when present at a concentration of 0.1 ug/ml or greater. At cleavage-inhibitory concentrations, PMA did not inhibit synthesis of protein; drug effects upon synthesis of DNA seemed to be secondary to changes in karyokinesis. The microscopic and biochemical effects of PMA closely resembled those of colchicine; they differed significantly from the effects produced by dinitrophenol, usnic acid, cyclohexamide, beta-mercaptoethanol and dithiothreitol. Both 6-NH2 and 8-SH substitutions on the purine molecule were necessary for cleavage inhibitory potency. Marginal protection against cleavage inhibition was afforded by mercaptopurines, mercaptopurine ribosides and cysteine, but not by purines, purine ribosides, methylmercaptopurine or cystine. (LeGore-Washington)

SOME EFFECTS OF DETERGENTS IN THE MARINE ENVIRONMENT,
University of Strathclyde, Glasgow (Scotland). Dept. of Biology.
E. J. Perkins.
Chemistry and Industry, p 14-22, 3 Jan 1970. 5 fig, 10 tab, 4 ref.

Descriptors: *Bioassay, *Lethal limit, *Toxicity, *Emulsifiers, *Water pollution effects, *Water pollution treatment, *Growth rates, *Detergents, Toxins, Aromatic compounds, Resistance, Poisons, Gastropods, Mollusks, Snails, Oil, Oil wastes, Oily water, Water pollution sources, Mortality, Pollutants, Treatment, Surfactants.
Identifiers: *BP 1002, *Oil spills, *Oil spill treatment, *Growth inhibition, *Torrey Canyon, *Tarsolvent (Petrofina), *Slickgone (Dasic), Littorina sp., TLm, Nucella sp., Buccinum sp., Concentrations, Dose.

This study concerned the physiological consequences of apparently sub-lethal concentrations of detergents. Three species of gastropods (Littorina spp. and Nucella sp.) were exposed to severe and to graded concentrations of various detergents (BP 1002, octyl phenol ethoxylate surfactant (DS 4359), Dasic 'Slickgone,' or Petrofina 'Tarsolvent'), and were returned to a natural environment. In all cases, considerable delay was required for full development of the mortality pattern. Seven day interpretations of effects were found inadequate, and effects were still evident as long as 22 weeks post-exposure. Both mortality and growth inhibition may be significant at very low concentrations, while inactivation may have more effect on survival than do TLm concentrations. (LeGore-Washington)
W71-07903

ORGANOCHLORINE INSECTICIDE RESIDUES IN FISH (NATIONAL PESTICIDE MONITORING PROGRAM),
Bureau of Sport Fisheries and Wildlife, Fort Collins; and Bureau of Sport Fisheries and Wildlife, Washington, D.C.
Croswell Henderson, Wendell L. Johnson, and Anthony Inglis.
Pesticides Monitoring Journal, Vol 3, No 3, p 145-171, Dec 1969. 1 fig, 4 tab, 23 ref.

Descriptors: *Pesticide residues, *Chlorinated hydrocarbon pesticides, *Monitoring, *Water pollution effects, Pesticides, Residues, Bioassay, Fish physiology, Pollutants, DDT, Dieldrin, Aldrin, Endrin, Heptachlor, Agricultural chemicals, Food chains, Pesticide drift, Public health, Chromatography, Analytical techniques, Chemical analysis, Data collections, Fish diseases.
Identifiers: DDE, TDE, Lindane, Heptachlor epoxide, Chlordane, Toxaphene, Column chromatography.

As a part of the National Pesticide Monitoring Program, fish were collected from 50 sampling stations located in the Great Lakes and in major river basins throughout the United States. Three composite samples, consisting of 5 adult fish of each of 3 species, were collected at all stations during the spring and fall of 1967 and 1968. The samples were analyzed for residues of 11 organochlorine insecticides. DDT and/or metabolites were found in 584 of the 590 composite samples, with values ranging to 45 ppm (mg/kg wet weight, whole fish). Dieldrin was found in 75% of the samples, with values ranging upward to nearly 2 ppm. Other organochlorine insecticide residues were found in fewer samples, but some had fairly high residue levels. Relatively high residues of DDT and metabolites, dieldrin, heptachlor, heptachlor epoxide, and chlordane were found consistently during all sampling periods at some stations. (LeGore-Washington)
W71-07904

HISTOPATHOLOGICAL EFFECTS OF THE INSECTICIDES, HEPTACHLOR AND NICOTINE, ON THE GILLS OF THE CATFISH, HETEROPNEUSTES FOSSILIS,
Kalyani Agricultural Univ. (India). Dept. of Zoology.
Sushil Kanta Konar.
Japanese Journal of Ichthyology, Vol 15, No 4, p 156-159, 1969. 1 fig, 6 ref.

Descriptors: *Heptachlor, *Animal pathology, *Respiration, Fish physiology, Catfish, Fish behavior, Fish toxins, Fishkill, Toxicity, Pesticide toxicity, Water pollution effects, Insecticides.
Identifiers: *Nicotine, *Histopathological effects, *Fish gills, Mucus, Respiratory distress, Heteropneustes fossilis.

The fishes exposed to 1.0 ppm of heptachlor and 3.2 ppm of nicotine at room temperature (18.89-23.89C) died within 19 to 44 hours. The fishes exhibited acute respiratory distress with both insecticides. The gills of fishes exposed to heptachlor were found coated with a layer of mucus, but no such covering was found on the gills of those which died in nicotine. The surface cells of the gill filaments of fishes killed by heptachlor showed disintegration, rupture, vacuolation, karyorrhexis, and extrusion and degeneration of nuclei and cytoplasm. The number of mucous cells in these gills was increased which resulted in the secretion of mucus over them. With nicotine, only the basal parts of a few gill filaments were damaged. Injury with heptachlor was due to surface irritation rather than absorption of the poison through the gills. Due to paralytic action induced by nicotine, the fishes failed to renew water of their opercular chamber which resulted in asphyxiation and finally death. (Sjolseth-Washington)
W71-07905

PESTICIDES IN THE ANTARCTIC,
Pennsylvania State Univ., University Park.
J. L. George, and D. E. H. Frear.
Journal of Applied Ecology, 3 (suppl), p 155-167, June 1966. 3 ref, 6 tab.

Descriptors: *DDT, *Pesticides residues, *Antarctic, Antarctic Ocean, Gas chromatography, Snow, On-site data collections, Pesticide drift.
Identifiers: *Weddell Seals, *Penguins, Tissue analyses, Skua, Trematomus bernacchi, Rhigophila dearboni, DDE.

The Antarctic was investigated for the presence of pesticides. Samples of snow soils, fauna and flora were collected. Measurements able to detect 0.0005 ppm in water, 0.005 ppm in animal tissues, detected no residues in fifteen snow samples nor in seven samples of invertebrates from four phyla. Residues were found in vertebrates: only in one of eight samples of three fish species and none in one Emperor Penguin, but four of sixteen Adelie Penguin, four of sixteen Weddell Seals and fifteen o sixteen Skuas contained residues in one or more tis sues. Maximum residues in ppm wet weight were 0.44 DDT in the fish Rhigophila, 0.18 DDT i Adelie Penguins, 0.15 DDT in Weddell Seals, an 2.8 DDE in Skuas. Pesticides, therefore, occur i the Antarctic, thousands of kilometers from th nearest point of use. The residues are much highe in the fatty issues of vertebrate predators than i the general environment. (Sjolseth-Washington)

MORTALITY AT SOUTHEND,
British Museum of Natural History, London (En gland).
J. David George.
Marine Pollution Bulletin, Vol 1 (NS), No 9, Sep 1970. 1 p.

Descriptors: *Oil, *Oily water, *Detergent *Emulsifiers, *Water pollution effects, Mussel Shellfish, Annelids, Snails, Gastropods, Mollusk Crabs, Water pollution treatment, On-site i vestigations, Evaluation, Pollution (Water), Mo tality, Pollutants, Toxins, Poisons, Mud flats.
Identifiers: *BP 1002, *BP 1100, *Polychaete *Oil spills, Mytilus edulis, Ulva sp., Enteromorph sp., Fucus sp., Balanus sp., Littorina sp., Carcin sp., Arenicola sp., Neanthes sp., Nerine sp Nephtys sp., Cockles.

On July 27, 1970 a pipeline at Mobil's Coryto refinery in the Thames Estuary was fractured, a 400,000 kg of oil was released into the sea. Dispe sant spray and a dispersant/freshwater mixtu were used for cleaning operations. Extensive mo talities of several species of polychactes, snails, species of cockle, mussels and crabs occurred intertidal muddy sand flats within 100 m of t shore. Seaweeds on the seawall were damaged the dispersants, but the extent of damage is u clear. Mortality may have been abetted, or ev caused, by the large quantities of freshwater us to flush oil-affected areas. (LeGore-Washington)

A brief survey was made of the effects of 20,0 barrels of diesel oil and Bunker C spilled offsh of Galeta Island, Canal Zone, when the tanker W water was wrecked in late 1968. Rocky shor coral reefs, sandy beaches and mangrove ar were observed. Intertidal communities were m severely affected. This was particularly true of mangrove areas, where intertidal algal and seder ry faunal communities were virtually destroy Species having to penetrate the air-water interfa such as turtles, were severely affected. The m groves themselves were damaged, and the fidu crab populations were decimated. Sandy sh meiofaunal populations were dramatically reduc and rocky shore fauna was damaged. Subtidal co was not obviously affected. Detergents were used to clean the spill. (LeGore-Washington)

s, *Water pollution effects, *Hydrogeology,
ucky, Rainfall-runoff relationships, Erosion,
entation, Sediment yield, Aquatic life, Acid
vater, Sulfates, Hydrogen ion concentration.
iers: *Beaver Creek Basin (Ky).

nining of coal in the Beaver Creek basin in
central Kentucky has significantly increased
cidity and mineralization of surface and
lwater and increased the sediment content of
s in the mined area. These effects, in turn,
reduced or eliminated aquatic life in the
s. Influences of mining on the hydrologic en-
ment are limited largely to the Cane Branch
nd to Hughes Fork downstream from Cane
n. Beaver Creek, 3 miles downstream from
ined area, is relatively unaffected. An ex-
ion of the hydrologic data for a progressive
e in runoff characteristics of Cane Branch
uld be related to the history of mining in the
failed to indicate any such change. There
een no significant changes in the occurrence
ovement of groundwater in bedrock and
n the vicinity of the southwest spoil bank
bservations began in 1958. (See also W71-
thru W71-07943) (Knapp-USGS)

IPITATION AND RUNOFF,
gical Survey, Washington, D.C.
IcCabe.
luences of Strip Mining on the Hydrologic
nment of Parts of Beaver Creek Basin, Ken-
1955-66, Geological Survey Professional
427-C, p C5-C9, 1970. 5 p, 4 fig, 1 tab.

ptors: *Strip mines, *Acid mine water,
all-runoff relationships, *Kentucky, *Water
on sources, Coal mines, Runoff, Data collec-
Hydrologic data, Rain gages, Stream gages,
ine wastes, Path of pollutants.
iers: *Beaver Creek Basin (Ky).

The runoff characteristics of Cane Branch and Helton Branch basins of Kentucky were studied to relate any observed differences between the two basins to differences in their exposure to strip mining. The drainage basin of Cane Branch includes strip-mined areas, whereas the drainage basin of Helton Branch has not been disturbed by strip mining. There were measurable differences in runoff characteristics between the two basins, despite the fact that similar percentages of annual precipitation go to runoff and evapotranspiration in each basin. Application of both flow-duration and annual-flood methods to analysis of stream hydrographs indicated that Cane Branch has greater peak flows per square mile of drainage area and more rapid changes in discharge, but Helton Branch has greater base flows. However, an examination of the hydrologic data for progressive change in runoff characteristics of Cane Branch that could be related to the history of mining in the area failed to indicate any such change. GROUNDWATER,
Geological Survey, Washington, D.C.
H. T. Hopkins, and D. S. Mull.
In: Influences of Strip Mining on the Hydrologic Environment of Parts of Beaver Creek Basin, Kentucky, 1955-66, Geological Survey Professional Paper 427-C, p C9-C14, 1970. 6 p, 4 fig.

Descriptors: *Strip mines, *Strip mine wastes, *Hydrogeology, *Groundwater movement, Water levels, Data collections, Hydrologic data, Aquifers, Recharge, Water pollution sources, Path of pollutants, Kentucky.
Identifiers: *Beaver Creek Basin (Ky).

The effects of mining on the occurrence, movement, and quality of groundwater were studied in the Cane Branch study area, Kentucky. Groundwater in the essentially unmined West Fork Cane Branch study area was also investigated to provide a basis for comparison. There has been no significant change in the occurrence and movement of groundwater in the vicinity of the southwest spoil bank since beginning of observations in the spring of 1958. Shallow groundwater in bedrock is recharged by precipitation and moves from topographically high areas to streams. Groundwater in the southwest spoil bank is recharged by direct infiltration of precipitation and seepage from adjacent pools, and it discharges mostly eastward into tributaries drainage the spoil bank area. Fluctuations of the water table in the spoil bank are largely controlled by direct infiltration of precipitation during the winter-spring season, but they are strongly influenced by seepage from pools adjacent to the spoil bank during the summer-autumn season. The shape and slope of the water table in the spoil bank have not changed significantly since observations began in 1958. (See also W71-07935) (Knapp-USGS)
W71-07937

GEOCHEMISTRY OF WATER,
Geological Survey, Washington, D.C.
J. J. Musser, and R. J. Pickering.
In: Influences of Strip Mining on the Hydrologic Environment of Parts of Beaver Creek Basin, Kentucky, 1955-66, Geological Survey Professional Paper 427-C, p C14-C30, 1970. 17 p, 9 fig, 7 tab.

Descriptors: *Strip mines, *Acid mine water, *Water pollution effects, *Water quality, *Path of pollutants, Surface waters, Streamflow, Water pollution sources, Hydrogeology, Sulfates, Geochemistry, Leaching, Erosion, Kentucky.
Identifiers: *Beaver Creek Basin (Ky).

One of the environmental factors most obviously influenced by strip mining in the Cane Branch basin of Kentucky is the chemical composition of the water. Cane Branch is an acid stream because of strip mining. This report describes and evaluates (1) changes in the chemical composition of water in the Cane Branch study area, (2) the chemical composition of water in nearby study areas unaffected by mining, and (3) the general persistence of acid water downstream from the Cane Branch mining area. Although fluctuations of annual mean concentrations due to climatic variations have made it difficult to identify a definite trend during the period 1962-66, apparently there was little change in the rate of chemical weathering or in the chemical composition of the water in Cane Branch during the last 5 years of the study. As the acid mine drainage from the Cane Branch area moves downstream, it is diluted and neutralized by inflow from streams containing bicarbonate alkalinity. The effects of the mine drainage are almost undetectable at the point where water from Little Hurricane Fork enters Beaver Creek, and Beaver Creek below this point has a slightly acid pH like that of neighboring streams unaffected by acid mine drainage. (See also W71-07935) (Knapp-USGS)
W71-07938

EROSION AND SEDIMENTATION,
Geological Survey, Washington, D.C.
C. R. Collier.
In: Influences of Strip Mining on the Hydrologic Environment of Parts of Beaver Creek Basin, Kentucky, 1955-66, Geological Survey Professional Paper 427-C, p C31-C46, 1970. 16 p, 12 fig, 1 tab.

Descriptors: *Strip mines, *Strip mine wastes, *Erosion, *Sedimentation, *Sediment yield, Provenance, Vegetation effects, Gully erosion, Sheet erosion, Stream erosion, Kentucky.
Identifiers: *Beaver Creek Basin (Ky).

The sediment characteristics of Cane Branch, Kentucky, were greatly affected by strip mining in the headwaters of the stream. The sediment yield from unmined areas averaged about 25 tons per square mile per year, whereas from 1959 to 1962, erosion of the spoil banks in the Cane Branch basin resulted in an average yield of more than 27,000 tons per square mile of spoil bank per year. Sheet erosion on the gently sloping top of the spoil bank decreased appreciably, whereas loss of material by gully erosion increased with time. Erosion of abandoned coal haul roads in the Cane Branch basin was severe in places where the roads had steep grades. Since the fall of 1959, when mining ended on the northeast side of Cane Branch, there has been no overall reduction in the amount of sediment discharged by Cane Branch. However, the particle size of the sediment in transport and in the channel and flood-plain deposits of Cane Branch has become coarser since the 1959 mining. (See also W71-07935) (Knapp-USGS)
W71-07939

STREAM BOTTOM FAUNA,
Kentucky Dept. of Fish and Wildlife Resources, Frankfort.
J. P. Henly.
In: Influences of Strip Mining on the Hydrologic Environment of Parts of Beaver Creek Basin, Kentucky, 1955-66, Geological Survey Professional Paper 427-C, p C46-C49, 1970. 4 p, 3 fig, 3 tab.

Descriptors: *Water pollution effects, *Acid mine water, *Strip mines, *Strip mine wastes, *Benthic fauna, Kentucky, Aquatic life, Benthos, Mayflies, Sampling, Water quality, Toxicity.
Identifiers: *Beaver Creek Basin (Ky).

Strip mining of coal in the Cane Branch Basin of Beaver Creek, Kentucky affected the invertebrate bottom fauna of both Cane Branch and its receiving stream, Hughes Fork. Acid water and sediment that were subsequently transported to the stream from the strip-mined areas resulted in a loss of invertebrate bottom fauna in Cane Branch and Hughes Fork. In spite of a limited repopulation of benthic fauna observed in Hughes Fork in 1964, this loss can be expected to persist in both streams for many years. Not until the strip-mined area is healed and stream habitat restored will aquatic life return to the two streams in any great numbers. (See also W71-07935) (Knapp-USGS)

W71-07940

FISH POPULATION,
Bureau of Sport Fisheries and Wildlife, Washington, D.C.
J. R. Sheridan.
In: Influences of Strip Mining on the Hydrologic Environment of Parts of Beaver Creek Basin, Kentucky, 1955-66, Geological Survey Professional Paper 427-C, p C50-C53, 1970. 4 p, 1 fig, 4 tab.

Descriptors: *Water pollution effects, *Acid mine water, *Strip mines, *Toxicity, *Fishkill, Kentucky, Fish, Sampling, Hydrogen ion concentration, Water quality, Fish populations.
Identifiers: *Beaver Creek Basin (Ky).

Fish life disappeared from Cane Branch, Pennsylvania, when its water became highly acid as a result of strip mining of coal during the period 1955-56. The fish population in Hughes Fork, which received the acid water from Cane Branch, was severely restricted. Differences in pH among the streams are very evident, especially the contrast between Cane Branch and the unaffected streams. The pH of 3.2 measured in Cane Branch is lethal to fish; pH values of 5.5 and 6.0 for the affected part of Hughes Fork suggest that the stream is not toxic to all species; yet fish were not present. Some recovery apparently occurred by 1964 in Hughes Fork just above Freeman Fork, but it did not result in a fishable population. (See also W71-07935) (Knapp-USGS)
W71-07941

MICROBIOLOGY OF STREAMS,
Kentucky Univ., Lexington. Dept. of Microbiology.
R. H. Weaver, and H. D. Nash.
In: Influences of Strip Mining on the Hydrologic Environment of Parts of Beaver Creek Basin, Kentucky, 1955-66, Geological Survey Professional Paper 427-C, p C53-C57, 1970. 5 p, 1 fig, 4 tab.

Descriptors: *Aquatic microorganisms, *Acid mine water, *Strip mines, *Water pollution effects, *Kentucky, Sulfur bacteria, Water quality, Sulfates, Hydrogen ion concentration, Algae, Bacteria, Water pollution sources.
Identifiers: *Beaver Creek Basin (Ky).

Drainage from strip-mined areas appears to have affected the microflora of Cane Branch, Kentucky. Chemical oxidation of pyritic compounds found extensively in spoil banks has resulted in the formation of ferrous sulfate and sulfuric acid. This appears to have led to the establishment in the mined part of the Cane Branch study area of Ferrobacillus ferrooxidants, which contributes to the production of acid entering the stream. The lowering of pH has enabled this organism to exist throughout the stream from the vicinity of the spoil banks downstream to the gaging station. Standard plate counts show a much smaller number of saprophytic bacteria in Cane Branch than in Helton Branch. This, too, can be attributed to the low pH of Cane Branch. The filamentous fungi are more numerous and diversified in Cane Branch than in Helton Branch. In addition, the yeast, Rhodotorula, which is associated with increased acid production by Thiobacillus ferrooxidans, and the alga Bumilleria were isolated only from Cane Branch. (See also W71-07935) (Knapp-USGS)

TREE GROWTH,
Geological Survey, Washington, D.C.
R. S. Sigafoos.
In: Influences of Strip Mining on the Hydrologic Environment of Parts of Beaver Creek Basin, Kentucky, 1955-66, Geological Survey Professional Paper 427-C, p C57-C59, 1970. 3 p, 3 fig, 1 tab.

Descriptors: *Water pollution effects, *Strip mines, *Vegetation effects, *Trees, *Kentucky, Acid mine water, Sedimentation, Soil erosion, Land clearing, Water quality, Mine wastes.
Identifiers: *Beaver Creek Basin (Ky).

The net effect of strip mining upon the forests in the Cane Branch basin, Kentucky is negative. The area mined was cleared of trees at the time of mining, and after a recovery period of 10 years did not support the number of trees that a comparable area of abandoned cultivated land supported. Furthermore, some trees that were not destroyed at the time of mining subsequently died, probably because of burial by sediment, and other trees may have had their growth inhibited as a result of irrigation by mine drainage. COLUMBIA RIVER EFFECTS IN THE NORTHEAST PACIFIC, REPORT OF PROGRESS, JUNE 1969 THROUGH JUNE 1970,
Washington Univ., Seattle. Dept. of Oceanography.
Clifford A. Barnes.
Available from the National Technical Information Service as RLO-1725-180, $3.00 in paper copy, $0.95 in microfiche. Progress Report, July 10, 1970. 20 p, 8 fig, 1 tab, 3 append. USAEC Contract AT (45-1)-1725.

Descriptors: *Columbia River, *Water chemistry, *Aquatic microbiology, *Aquatic environment, Water pollution effects, Sedimentation, Water quality, Hydrology, Pacific Ocean.

Research conducted on the Columbia River effects in the Northeast Pacific Ocean by the Department of Oceanography of the University of Washington from June 1969 through June 1970 is summarized. The subject areas covered include (1) the physical, (2) the chemical-geochemical-geological-geophysical, and (3) biological aspects of the Columbia River system. The ocean area of primary interest to the project extends from San Francisco Bay at 38 degrees N to Vancouver Island at 49 degrees N, seaward some 600 km, and into the Strait of Juan de Fuca. DEMONSTRATING THE EFFECTS OF NUTRIENTS IN BIO-OXIDATION POND RECEIVING STREAMS,
Oklahoma Univ., Norman. Bureau of Water Resources Research.
George W. Reid, Leale E. Streebin, and Oliver T. Love Jr.
Available from the National Technical Information Service as PB-199 269, $3.00 in paper copy, $0.95 in microfiche. Mar 1971. 72 p, 16 fig, 10 tab, 49 ref, append. Environmental Protection Agency Program 16010--03/71, Demonstration Grant WPD-98-01-66.

Descriptors: *Eutrophication, *Oxidation lagoons, *Sewage lagoons, Biodegradation, *Nutrients, Algae, *Degradation (Stream), Water pollution effects, Waste water treatment, Cyanophyte, Englenophyta, Organic loading.

This study considered the receiving stream as an integral part of the bio-oxidation pond method of treatment with the objective being to provide a better understanding of the bio-oxidation pond - receiving stream system. As representative of this 'real world' situation with all of its variables, five existing central Oklahoma bio-oxidation ponds which had diverse loadings and designs were utilized. By observing these systems under varying climatic conditions, the effects of the bio-oxidation pond nutrients along with other pollutional parameters which were discharged into intermittent receiving streams were evaluated. Except for scouring, bio-oxidation ponds and bio-oxidation pond receiving streams were found to behave essentially the same as the streams became a continuation of the pond. In addition to making biochemical adjustments, the streams lost much of their biological identity and assumed characteristics more closely associated with the biological loadings from the pond effluent. The most persistent algae in the systems were the flagellates (Euglenophyta) and the blue-green algae (Cyanophyta) as these plankters had little difficulty making the transition from their acclimated life in the pond to the stream.

cypris salinus, Gasterosteus aculeatus, Baltic
Nitocra spinipes.

salt water mite Hyadesia fusca has been rded in Scandinavia for the first time. It is en- restricted to the green alga Enteromorpha in littoral zones or in rockpools, and is the inant fauna of many brackish water rockpools. algae serve as substratum, food and breeding and give rise to violent fluctuations in abiotic ronmental parameters. Oxygen availability and ogen-ion activities do not differ greatly inside outside the algal thalli. During breeding in June July more than 900 animals, mostly larvae, be found on 0.1 gram Enteromorpha dry ht. In winter and average of 13 hibernating als were found per 0.1 gram algae. Copulation ws after a long precopula; newborn larvae are found near the rhizomes inside algal tubes. mite is very tolerant of salinity variations. lesia fusca is characteristic of rockpool ystems, often very abundant, one of the few romorpha grazers of the ecosystem and serves od for fishes in the system. Together with some r known crustaceans this mite, because of its ance and survival capabilities, must be con- ed one of the hardient members of the unsta- ockpool ecosystems. riptors: *Chlorinated hydrocarbon insecti- s, *Retention, *Rainbow trout, Insecticides, , Dieldrin, Fish, Metabolism, Lipids, Enzymes. tifiers: *Residual insecticide interactions, *In- cide interactions, Tissues, DDE, Methox- or.

t organisms are probably exposed to several in- cides in their environments and many types been found to contain residues of more than insecticide. Insecticide interaction effects in ow trout simultaneously treated with up to organochlorine insecticides was studied with ion to residual insecticides accumulated in the ral fat body. DDT, methoxychlor, and dieldrin in three levels each were used in a randomized factorial design. Analysis was made for lipid content and residues. The insecticide-containing fraction was analyzed by gas chromatography with electron capture detection. Tissue storage of DDT and DDE increased when DDT and dieldrin were fed in combination. The response was the same as in rats, but was intensified in fish. Dieldrin storage was reduced by the presence of either DDT of methoxychlor. The effect of methoxychlor was more pronounced than that of DDT; feeding DDT with methoxychlor resulted in decreased methoxychlor storage. The influence of dieldrin on increasing tissue methoxychlor was highly significant. Insecticide interactions in fish and rats differ greatly. DDT, and possibly methoxychlor, could bring about a selective induction of drug metabolizing enzymes in the liver of trout. (Jones-Wisconsin) W71-08030

OXYGEN CONSUMPTION AND THE RESPIRATORY PIGMENT IN THE FRESH-WATER NEMERTEAN, PROSTOMA RUBRUM,

Bridgeport Univ., Conn. Dept. of Biology.

John J. Poluhowich.

Comparative Biochemistry and Physiology, Vol 36, p 817-821, 1970. 2 fig, 1 tab, 20 ref.

Descriptors: *Aquatic animals, *Oxygen, *Worms, *Respiration, Freshwater animals, Pigments, Fresh water, Weight, Metabolism, Connecticut, Anaerobic conditions.

Identifiers: *Nemerteans, *Prostoma rubrum, Heme-pigment, Hemoglobin, Phylum, Respiratory pigment.

Representatives of the Nemertea, acoelomate worms, inhabit marine, freshwater, and terrestrial environments. The oxygen consumption and respiratory rate of Prostoma rubrum were determined at 20C. The mean respiratory rate for 49 specimens was 0.700 microliters of oxygen/mg dry weight per hour. Oxygen consumption varied with the 0x478 power of the body weight. Treatment of the worms with gas mixtures having low oxygen tensions had little effect upon the respiratory rate. However, in similar atmosphere containing carbon monoxide, the oxygen consumptions were markedly reduced. The possibility exists that the respiratory enzymes of this animal are extremely sensitive to carbon monoxide and the decreased oxygen consumption in treated animals may reflect an interference by this gas. Chemical tests confirmed that the red coloration is, at least partially, due to the presence of a heme-containing pigment. Definite rhomboid crystals of the hemochromogen were observed in the Prostoma preparation after the addition of the Takayama reagent. Apparently the blood pigment of Prostoma rubrum allows it to respire at a constant rate under conditions of low oxygen tensions. (Jones-Wisconsin) W71-08031

Identifiers: *Coexistence, *Triclads, Britain, Food partitioning, Polycelis nigra, Polycelis tenuis, Interspecific competition, Dugesia polychroa, Dendrocoelum lacteum, Asellus, Serological technique, Intraspecific competition.

To explain distribution of four species of triclads living together in shallow littoral zones of British lakes, a hypothesis was developed relating to their distribution and abundance on the basis of interspecific competition for food. Because direct examination of the gut contents was unprofitable, a serological technique made possible the first comparative study of natural food of lake-dwelling triclads. A positive precipitin reaction obtained from a squash of a triclad when tested with the antisera indicates which prey had been consumed; a negative reaction indicates that these prey had not been consumed within the detection period. The triclad populations of 12 lakes, involving tests of 2282 animals were examined. Although the diets overlap, Polycelis tenuis and Polycelis nigra feed to a greater extent on oligochaetes, Dugesia polychroa on gastropods, and Dendrocoelum lacteum on Asellus. The distribution of Dendrocoelum lacteum is significantly associated with Asellus; it is not linked with the distribution of Gammarus another prey consumed less. While there were changes in proportions of the various prey at different seasons, diets were similar within a species and characteristic of that species. (Jones-Wisconsin) W71-08033

THE COPEPODA AND CLADOCERA OF A MISSOURI RIVER RESERVOIR: A COMPARISON OF SAMPLING IN THE RESERVOIR AND THE DISCHARGE,

Bureau of Sport Fisheries and Wildlife, Yankton, S.D.

Bruce C. Cowell.

Limnology and Oceanography, Vol 12, No 1, p 125-136, 1967. 6 fig, 4 tab, 17 ref.

Descriptors: *Measurement, *Plankton, *Automation, Sampling, Reservoirs, Copepods, Crustaceans, Missouri River, Standing crop, Lakes, Plankton nets, Zooplankton.

Identifiers: *Automatic sampler, Cladocerans, Gavins Point Dam (S D-Neb), Lewis and Clark Lake, Niobrara River (Neb).

Monitoring of plankton was accomplished by an automatic sampler installed at discharges from Lewis and Clark Lake. The results of sampling coincided with those obtained with tow nets. The annual discharge of Copepoda and Cladocera on wet basis was estimated in the proximity of 13 tons. The discharge was influenced by the inflow of zooplankton from Lake Francis, 80 km upstream, to a greater extent than by the inflow from tributary creeks. PRODUCTION OF MALE GAMETES AND AUXOSPORES IN A POLYMORPHIC CLONE OF THE CENTRIC DIATOM CYCLOTELLA,

Connecticut Univ., Storrs. Biological Sciences Group.

Mary E. Schultz, and Francis R. Trainor.

Canadian Journal of Botany, Vol 48, No 5, p 947-951, 1970. 3 fig, 3 tab, 12 ref. OWRR Project A-014-CONN (2).

Descriptors: *Diatoms, *Cytological studies, Salinity, Plant morphology.

Identifiers: *Cyclotella, Cyclotella cryptica, Cyclotella meneghiniana, Valve morphology, Auxospore production, Clones, Polymorphism, Toxonomy, Male gametes, Heterotrophs.

Increase in salinity of the medium induced the vegetative cells of Cyclotella clone (03A) to form male gametes and auxospores. During the clonal development of the auxospores, Cyclotella meneghiniana and C cryptica exhibited two valve patterns. Environmentally controlled valve morphology is distinguishable, the male gamete of the polymorphic clone being anteriously uniflagellate. (Wilde-Wisconsin) W71-08037

STUDIES ON THE POST-MORTEN IDENTIFICATION OF THE POLLUTANT IN FISH KILLED BY WATER POLLUTION--XII. ACUTE

POISONING WITH MERCURY (1), (IN JAPANESE),
Tohoku Univ. Sendai (Japan). Dept. of Fisheries; and Miyagi Technical Coll. (Japan). Dept. of Metal Engineering.
Yoshiko Haga, Hideo Haga, Tokiko Hagino, and Teiji Kariya.
English summary. Bulletin of the Japanese Society of Scientific Fisheries, Vol 36, No 3, p 225-231, 1970. 1 fig, 7 tab, 8 ref.

Descriptors: *Fish, *Water pollution effects, *Toxins, Aquatic animals, Aquatic environment, Chemical wastes, Inorganic compounds, Pollutant identification.
Identifiers: *Mercury, Carassius auratus, Tolerance limit, Gill, Kidney, Spleen, Abukuma River (Japan), Hirose-Natori River (Japan), Zacco platypus.

An attempt was made to detect mercury in fish killed by mercuric chloride in solution. The 48-hour median tolerance limit of mercuric chloride for goldfish lay between 1 and 0.5 ppm mercury and 5 ppm mercury was fatal in about 10 hours. Mercury content of control fish (fish killed by various concentrations) and of those living in 0.5 ppm mercury solution for 48 hours is given. Goldfish died in 0.5 ppm mercury solution within 6 or 7 days. Amount detected in dead fish is given. The distribution of mercury in seven parts of fish body was examined in two cases; the first being killed by mercury in solution and the second after soaking in mercury solution following death from suffocation. The first showed the highest value in the gills with that in the kidney next. In the second, mercury content showed low values in every part examined and scarcely detectable in spleen and kidney. Tests on some aquatic animals were performed to determine the possibility of mercury distribution in the Abukuma and Hirose-Natori Rivers with results indicating no mercury pollution. (Jones-Wisconsin)

DETERMINATION OF THE ACTIVITY OF HETEROTROPHIC MICROFLORA IN THE OCEAN USING C-14-CONTAINING ORGANIC MATTER,
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
Yu. I. Sorokin.
Trans from MIKROBIOLOGIYA, Vol 3, No 1, Jan-Feb 1970. Microbiology (USSR) Vol 39, No 1, p 133-138, 1970. 5 fig, 4 tab, 22 ref.

Descriptors: *Oceans, *Organic matter, *Carbon radioisotopes, *Analytical techniques, *Marine microorganisms, Marine plants, Bacteria, Population, Hawaii, Absorption, Tropical regions, Pacific Ocean, Columns, Bottom sediments, Algae, Chlorella, Benthic flora, Mud, Microorganisms, Proteins, Radioactivity techniques, Food chains.
Identifiers: *Algal hydrolysate, Tonga Islands, Tutuila Island, Honshu Island, Open ocean, Saprophytes, Heterotrophic bacteria, C-14.

The possibility of using carbon-labeled dissolved organic matter (algal hydrolysate) for estimating the comparative activity of natural populations of microflora in the water column and bottom deposits was investigated in the tropical zone of the Pacific Ocean. The criterion for microfloral activity was the rate of bacterial assimilation of carbon-14 in experiments of short duration. The rate and utilization efficiency of labeled organic matter by sea water microflora depend on its initial concentration. The maximum utilization efficiency of dissolved organic matter by aquatic microflora for biosynthesis was 45%, staying quite high even when the initial concentration of labeled hydrolysate added was 1 to 2 mg/l. Supported is the idea that bacterial destruction of organic material in the ocean is limited to the upper water layer to a depth of 600 to 800 meters, with the maximum in the tropical zone at depths of 400-600. At great ocean depths the heterotrophic microflora is scant and slightly active. Information about the efficiency of utilization of dissolved organic matter by the aquatic microflora is of paramount importance for estimating its role as a link in the food chain. (Jones-Wisconsin)

SATELLITE FUNGI OF MANGANESE-OXIDIZING BACTERIA,
Moscow State Univ. (USSR). Dept. of Soil Biology.
T. G. Mirchink, K. M. Zaprometova, and D. G. Zvyagintsev.
Trans from MIKROBIOLOGIYA Vol 39, No 2, Mar-Apr 1970. Microbiology (USSR) Vol 39, No 2, p 327-330, Mar-Apr 1970. 3 fig, 2 tab, 15 ref.

Descriptors: *Fungi, *Manganese, *Bacteria, Microorganisms, Podzols, Soils, Oxidation.
Identifiers: *Satellite fungi, Manganese-oxidizing bacteria, Metallogenium, Moscow (USSR), Novgorod (USSR), Estonia (USSR), Coniothyrium fuckelii, Mycogone nigra, Fusarium Kuhni, Alternaria geophila, Cephalosporium. Sterile mycelium, Manganese-oxidizing, Soil agar.

This investigation was made to determine species of fungi which exist in soil together with Metallogenium, how great their diversity, and how often found in soddy podzolic soil. Twenty-one strains of fungi growing together with microorganisms of the genus Metallogenium were isolated from soddy podzolic soils of the Moscow and Novgorod regions and Estonian SSR with the use of soil agar. The isolated satellite fungi of Metallogenium are represented by the species: Coniothyrium fuckelii Sac, Mycogone nigra (Morgan) Jensen, Fusarium Kuhni (Fuck) Sac, Alternaria geophila Dasz, Cephalosporium, and forms of sterile mycelium. The colonies of microorganisms were located either directly on the hyphae or at some distance from the mycelium. Cultures of fungi growing together with Metallogenium were regularly isolated from all soils used. On the media used many isolated cultures formed fruit-bodies, on the basis of which most of them were identified. The development of Metallogenium was greatly inhibited on these media with the use of streptomycin. The data obtained indicate that not one specific species of fungus but various species, represented mainly by known forms but which have acquired a unique structure due to coexistence with Metallogenium, can be satellite fungi of Metallogenium. THE EFFECTS OF RETURN IRRIGATION WATER ON THE BASAL LENS IN KAHUKU PLANTATION, OAHU AND PIONEER MILL AND HAWAIIAN COMMERCIAL AND SUGAR COMPANY PLANTATIONS ON MAUI,
Hawaii Univ., Honolulu.
Pedro A. Tenorio.
M. S. Thesis, Hawaii University, Aug 1970. 176 p, 66 fig, 7 tab, 54 ref, append. Project B-012-HI (2).

Descriptors: *Water pollution sources, *Water pollution effects, *Return flow, *Saline water intrusion, *Hawaii, Irrigation water, Water chemistry, Solutes, Nitrates, Salinity, Withdrawal, Groundwater, Groundwater movement, Leaching, Infiltration, Water quality.
Identifiers: Oahu (Hawaii), Maui (Hawaii).

The effects of irrigation return water on the quality of the basal groundwater bodies were identified and described in 3 areas on the islands of Oahu and Maui. Presently, all three areas are planted with sugarcane. Leaching of fertilizer components, principally nitrate and sulfate, into the basal aquifer occurs as a result of irrigation water application over the fields. Excessive withdrawals of the basal water in simple Ghyben-Herzberg lens accelerates saline water intrusion. All of the irrigation water sources from the three areas are suitable for the irrigation of sugarcane crop. (Knapp-USGS)

ifiers: Coastal topographic features, Oil base , Ion density concentration.

200,000 data points relating to range of enmental factors in all major Texas estuaries Louisiana to Mexico were utilized to establish bility of total salinity and constituent ions in estuaries. This was done to determine possiffects of oil field brines upon Texas coastal stems. Diversity and faunal abundance were ared with environmental variability. Baseline s for benthic and nektonic populations were lished for both undisturbed and industrially bed estuaries. In all bays, salinity and temure variations were very pronounced, geoically and temporally. Range of variation and winter and summer salinities could be ly correlated with sizes and diversity of l populations and with major changes from o year to seafoods. Data from 572 stations ng to ionic constituents of Texas bay waters statistically evaluated for their variability and ated into 'ionic balance' format. Extreme ility from time to time, and place to place nstrated that this concept of 'ionic balance' is d in estuaries systems.

iological rationale for water quality criteria to ize the environmental effects of power ation while at the same time maximizing the ts of economical power generation for manwill require the early involvement of ecolo- engineers and other specialists in the siting, and operation of steam electric generating stations. The author discusses thermal tolerance of aquatic organisms in different life stages, reaction of individual species to heat, speciation resulting from thermal stress, heat synergism and order of duration of temperature response. Fluctuations in temperature have been shown to have as great an effect on organisms as extremal temperatures, the effect being most stressing when the amplitude of change and its rate are greatest. Some beneficial effects of increased temperatures are pointed out. (See also W71-08298) (Oleszkiewicz-Vanderbilt)

On the basis of extensive literature study the authors arrive at the conclusion that releases of heat into tidal and marine environment must be carefully tailored and managed. Every effort should be bent toward developing methods to use the heated effluents in productive ways. These activities should, among the others, entail (1) development of adequate institutional mechanisms, (2) development of mathematical and hydraulic models for every major marine or coastal system, (3) more adequate siting criteria and water quality criteria and standards, (4) development of more flexibility in regional and interregional generating systems, (5) development of more adequate effluent pre-cooling systems and techniques to use the heat productively, (6) more efficient means of reducing environmental heat loading. CONFERENCE ON IMPACT OF FUTURE ELECTRIC POWER REQUIREMENTS IN THE STATE OF MINNESOTA - AN ISSUE ANALYSIS.
Minnosota Univ., Minneapolis. Water Resources Research Center.

Available from the National Technical Information Service as PB-199 542, $3.00 in paper copy, $0.95 in microfiche. Water Resources Research Center, Minnesota University, Graduate School, WRRC Bulletin 28, p 38, Feb 1971. OWRR Project A-999-Minn (1).

Descriptors: *Electric power demand, *Electric power production, *Thermal powerplants, *Environmental effects, *Thermal pollution, Air pollution, Solid wastes, Economic impact, Radiation, Transmission lines, *Minnesota.

The objectives of the conference were to discuss future electric energy needs in the state of Minnesota and alternative means for meeting these requirements. Issues identified were associated with: impact of power plant and transmission line proliferation on the natural environment, on the economics, on the life of the people, on the politico-legal situation in the affected areas and on the state if power plants and transmission lines are not built. Potential thermal water pollution was discussed, together with potential air pollution, solid wastes disposal problems, radiation hazards, land management schemes, and potential depletion of natural resources. The emphasis was on examination of all possible issues and not on problem solution. (Oleszkiewicz-Vanderbilt)

BACKGROUND STUDY FOR POND COOLING FOR INDUSTRY,
Oregon State Univ., Corvallis.
Fred W. Decker.
AEC AT (45-1). Mar 31, 1970. RLO-2218-1, 53 p.

Descriptors: *Thermal powerplants, *Nuclear powerplants, *Heated water, *Cooling towers, Rivers, Lakes, Fog, Biota, Thermal pollution.
Identifiers: *Cooling ponds.

The use of lakes and slack water for the disposition of waste heat from thermal power plants was studied based on European experience. Scientists appear preoccupied with the establishment of limits to the allowable discharge of heat into streams. In Switzerland and Bavaria work continues on the prescription of the limits as to how much and in what manner heat may discharge into streams. In the Netherlands already the forecast emerges of eventually more heat than the Rhine and impounded waters can handle. In France studies seek to specify limits for discharge of heat into the inland slack waters of major controlled rivers. In Britain the studies of a lake used for cooling a nuclear power plant will reveal objective data on the modifications in the lake conditions, but new construction generally assumes the use of cooling towers because of the general shortage of water available for cooling. It appears that cooling towers have superseded other methods for heat discharge and that increasingly many new major industrial units can no longer seriously consider rivers and lakes for their heat sinks, at least from a standpoint of economic advantage to themselves. (Oleszkiewicy-Vanderbilt)

A COMPREHENSIVE APPRAISAL OF THE EFFECTS OF COOLING WATER DISCHARGE ON AQUATIC ECOSYSTEMS,
Battelle Memorial Inst., Columbus, Ohio. Columbus Labs.
Arthur A. Levin, Birch J. Thomas, Robert E. Hillman, and Gilbert E. Raines.
Columbus, Ohio, 1970. 45 p, 9 fig, 2 tab, 137 ref.

Descriptors: *Thermal pollution, *Heated water, *Cooling water, *Aquatic environment, *Dissolved oxygen, Water temperature, Fishkill, Environmental effects, Parositism, Aquatic populations.
Identifiers: *Aquatic ecosystems, Thermal tolerances.

A discussion of the effects of cooling water discharge on receiving waters is given in the present report. It is stated that one of the most important effects on the aquatic ecosystem is the response of the aquatic biota either as a direct result of an increase in water temperature or as a subsequent result of physical-chemical changes of the water due to an increase in water temperature, such as: density, viscosity, vapor pressure, surface tension, solubility of dissolved gases in water, etc. can cause stratification of bodies of water, increase in evaporation and rate of biochemical reactions. Elevated temperatures increase the metabolic rate of most organisms until the upper lethal limit is reached. Analysis of the ability of water to hold adequate concentrations of dissolved oxygen to support aquatic organisms are also given. It is concluded that whether actively managed for the benefit of man or passively observed for their impact, thermal additions will cause environmental changes. With most of the actual operating plants, the changes due to thermal additions have not proved to be harmful. No major fishkills due to thermal effluents have been observed of operating power plants. 5D. Waste Treatment Processes

COST AND MANPOWER FOR MUNICIPAL WASTE WATER TREATMENT PLANT OPERATION AND MAINTENANCE,
Federal Water Quality Administration, Washington, D.C. Construction Grants and Engineering Branch.
R. L. Michel.
Journal Water Pollution Control Federation, Vol 42, p 1883-1915, Nov 1970. 20 fig, 31 tab, 9 ref.

Descriptors: *Costs, *Waste water treatment, *Operation and maintenance, Correlation analysis, Trickling filters, Lagoons.
Identifiers: *Total population equivalent, *Industrial population equivalent, Total weekly man-hours, Sludge process, Power consumption.

An analysis was made of the operation and maintenance expenditure and manpower requirements for waste water treatment works as reported for some 1,600 such audits during the period January 1965 to June 1968. A statistical test (simple linear correlation) was used to determine the trends between the following combinations of variables: (1) Total annual cost vs. average flow rate; (2) Total annual cost vs. population equivalent load; (3) Annual labor cost vs. average flow rate; (4) Annual labor cost vs. population equivalent load; (5) Annual electricity cost vs. average flow rate; (6) Annual electricity cost vs. population equivalent load; (7) Annual chemical cost vs. average flow rate; (8) Ahhual chemical cost vs. population equivalent load; (9) Total weekly man-hours vs. average flow rate; (10) Total weekly man-hours vs. population equivalent load. All the results were plotted on figures. In general, the cost patterns derived from this study were very similar to those derived from the 1,500 reports of a different set of plants audited between 1962 and 1965. (Wang-Rutgers)

ECONOMIC EVALUATION: ALTERNATIVES FOR INDUSTRIAL TREATMENT,
Wichita State Univ., Kans.
K. Q. Camin.
Water and Sewage Works, Vol 116, No 7, p IW/10 - IW/13, July 1969. 4 tab, 1 fig.

Descriptors: *Evaluation, *Costs, Biochemical oxygen demand, Discount rate, Trickling filters, Operation and maintenance, Cost comparisons.
Identifiers: *Alternatives, *Industrial waste treatment, Municipal waste treatment, Waste water strength.

With reduction of pollution content as their goal, industries whose manufacturing processes generate substantial wasteloads usually have several alternative solutions. This paper discussed what waste treatment alternative would give a specified amount of waste reduction at minimum cost. To illustrate the theory and method of evaluation, emphasis was placed upon 'municipal waste treatment' and 'industrial waste treatment.' It indicated that a change in wasteload (lb of BOD) per unit of product varied directly with waste water volume per unit of product. Cost for municipal treatment and industrial treatment were discussed respectively. For meaningful comparison all cost streams were converted into present value. It was noted that the optimal choice would change if the discount rate or the time horizon were different. (Wang-Rutgers)

CHEMICAL TREATMENT OF COMBINED SEWER OVERFLOWS.
Dow Chemical Co., Midland, Mich.

Copy available from GPO, Sup Doc as EP2.10:11023FDB $1.50; microfiche from NTIS as PB-199 070, $0.95. EPA Report 11023 FDB--09/70, Sept 1970. 185 p, 56 fig, 50 tab, 54 ref. EPA-WQO Contract No 14-12-9.

Descriptors: *Water pollution control, *Flocculation, Sedimentation, Storms, Runoff, Flow rates, Biochemical oxygen demand, Coliforms, Pumps, Chlorination, Disinfection, Baffles, Weirs, Waste water treatment, *Sewers, *Overflow.
Identifiers: *Combined sewers, Purifloc C31, Purifloc C32.

Less than 8% of the total sanitary sewage flow collected in the Milk River combined sewer has been by-passed during periods of storm overflow during the past 8 years. Total overflow volumes did not exceed 5.5 million cubic ft. 90% of the time. Initial BOD over 18 samples ranged from 23 mg/l to 376 mg/l with an average of 110 mg/l, while suspended solids averaged 249 mg/l. On final samples taken during the same period, BOD values averaged 42 mg/l and SS values averaged 67 mg/l. Chlorine demand for 56 influent samples averaged 7.7 mg/l. The receiving waters for these overflows were characterized by visual observation as being highly polluted. Cationic polymeric flocculants and flocculent aids were tested on combined overflows from the sewer system. It was found that the existing Milk River pumping station and retention basin were suitable for modification, namely the addition of weirs and variable rate pumping, to achieve an average SS removal of 63%. The installation of disinfection equipment was estimated to cost $20,625 with $7,700 annually for chemical costs. This equipment would produce a coliform density of 1000/100 ml at an average cost of approximately $.012/1000 gallons. (Lowry-Texas)

RENOVATION OF MUNICIPAL WASTE WATER BY REVERSE OSMOSIS,
Environmental Protection Agency, Cincinnatti, Ohio. Environmental Research Lab.
John M. Smith, Arthur N. Masse, and Robert P. Miele.
Copy available from GPO, Sup Doc as EP2.10:17040-05/70, $0.65; microfiche from NTIS as PB-199 067, $0.95. EPA Report 17040--05/70, May 1970. 59 p, 23 fig, 17 tab, 12 ref.

Descriptors: *Reverse osmosis, *Municipal wastes, Separation techniques, Desalination processes, Demineralization, Semi-permeable membranes, *Water re-use, Pressure, Hydrogen ion concentration, Filtration, Adsorption, Sedimentation, Pilot plants, Cost analysis, *Waste water treatment, Osmosis, *Membranes.
Identifiers: Flux, Rejection, Membrane fouling.

The three major configurations of reverse osmosis units include spiral wound units, tubular units, and plate and frame units. Tests were conducted on prototype units employing all three configurations, and the membranes were found capable of rejecting 93 to 95% of TDS, 90 to 99% of phosphates, 80 to 90% of ammonia nitrogen, 60 to 70% of nitrate nitrogen, 99 to 100% of particulate matter, 90 to 95% of TOC and greater than 90% of COD. Many of the problems discovered stemmed from the use of prototype units which had not been throughly tested and were subject to repeated mechanical failures. Fouling problems have been partially alleviated by periodically depressurizing the membranes and washing them with enzyme detergents. The success of this method is attributed to protein hydrolysis of the slime layer which coats the membrane. Increasing population has dictated the recycling of a much larger portion of the nation's water. Each time it is re-used, the water picks up greate amounts of dissolved solids. These solids will eventually have to be removed to preserve the potability of drinking water. At present, reverse osmosis techniques are the most promising methods for dissolved solids removals. Also, increasing advances in membrane materials have steadily decreased the cost of reverse osmosis to the point that a reverse osmosis system coupled with primary and sand filtration only has an estimated cost of 35.4 cents/1000 gallons. This figure is equal to the cost of conventional activated sludge treatment plus filtration and carbon adsorption. (Lowry-Texas)

ogical uptake, chemical precipitation of solu- hosphorus, and settling or filtration of particu- phosphorus are the major removal mechanisms in phosphorus removal. At present, chemical ipitation is the most universally applied hod. The wide variety of chemical reaction which lead to phosphorus precipitation allows much flexibility of operation to plant operators. In dealing with raw sewage, primary effluent, or secondary effluent the size of the plant, influent waste water characteristics phosphorus discharge standard, and the types of other processes used in the treatment train must all be considered. In addition to phosphorus removal, higher levels of BOD and suspended solids removals are customarily obtained when some type of phosphate reduction mechanism is employed. Each of the mechanisms described here have been analyzed both with respect to technological and economic feasibility. Costs ranged from 13 cents/1000 gallons for two-stage lime treatment of 1 mgd to achieve 97% removal, to a potential low of $.015/1000 gallons using waste pickle liquor to achieve a reduction of 80%. THE THERMAL STABILITY OF NITRILOTRIACETIC ACID AND ITS SALTS IN AQUEOUS SOLUTIONS,
Naval Research Lab., Washington, D.C.
David L. Venezky, and William B. Moniz.
Available from the National Technical Information Service as AD-715 776, $3.00 in paper copy, $0.95 in microfiche. NRL Report 7192, Nov 17, 1970. 11 p, 6 fig, 6 ref. NRL Problems CO5-29 and CO7-04 Project No RR007-02-41-5678 and RR001-05-42-4806.

Descriptors: *Temperature, *Stability, Chelation, Sludge, Hydrogen ion concentration, Waste water treatment, *Chemical precipitation.
Identifiers: *Thermal decomposition, Complexing, Nuclear magnetic resonance, Proton magnetic resonance, Nitrilotriacetic acid, *NTA.

H4EDTA and its salts may decompose thermally through a hydrogen three-centered bridge structure intermediate. By comparison, the thermal decomposition of H3NTA and its salts was studied using nuclear magnetic resonance techniques, since NTA is similar to EDTA, except that it cannot form the bridge structured intermediate mentioned previously. NMR studies at 200C for periods ranging from 1 hour to 670 hours were conducted on degassed and undegassed aqueous solutions of Na3NTA, Na2HNTA, and a degassed solution of H3NTA. Periodic proton magnetic resonance examination showed dissolved oxygen to have little or no effect on Na3NTA and Na2HNTA solution decomposition. Testing results showed NTA3- to be far more stable than EDTA4- at 200C. Extension of this data to the 300C to 320C range is not possible without additional testing. However, at 200C in basic solutions uncomplexed and weakly complexed NTA3- is stable enough to use as a boiler-water additive for sludge control and feedwater conditioning. Such use should produce minimal water contamination from thermally decomposed NTA3-, which could occur only after prolonged heating. (Lowry-Texas)

MAGNETIC FLOCCULATION REMOVES METALLIC SOLIDS.
Ericz Magnetics, Eric, Pa.

Water and Sewage Works, Vol 118, No 3, p IW/12-IW/13, Mar 1970.

Descriptors: *Waste water treatment, *Separation techniques, *Flocculation, Coagulation, Sedimentation, Settling velocity, Metals, Industrial wastes, Flow rate, Pennsylvania.
Identifiers: *Magnetic flocculation, Metallic wastes (Steel).

Metallic contaminants in waste water from steel plants have long required large settling basins with long detention times. Various chemical coagulation and flocculation agents have been tried with limited success, usually accountable to prohibitive cost. The development of a magnetic process, however, has doubled the settling rate of the floc with a 50% decrease in the amount of flocculants required. Also, magnetic solids entrap non-magnetic solids while they are settling to provide a sweeping effect. This phenomenon has stimulated interest in the addition of Basic Oxygen Furnace Dust to waste waters which do not contain any metallic particles. This BOF dust, when magnetized acts as a coagulant aid. Several combined chemical-magnetic flocculation units are already in use. A unit designed for Allegheny Ludium Steel Corporation treats approximately 3500 gpm by subjecting the waste water to a minimum field intensity of 800 gauss for 1/20 seconds. This water originates from the BOF units, but it can also be mixed with waters from the cupola scrubbers. The system then depends upon the magnetized flocs to clear the water of non-magnetized solids as well. At present, no reliable cost analysis has been performed, but research into magnetic treatment is continuing. (Lowry-Texas)

A PERFORMANCE ANALYSIS OF AN ACTIVATED SLUDGE TREATMENT PLANT,
Toronto Univ. (Ontario). Dept. of Civil Engineering.
D. F. Carr, and J. Ganczarczyk.
University of Toronto, Department of Civil Engineering, Publication No. 71-600, Feb 1971. 17 p, 10 fig, 7 tab, 4 ref. NRC Grant No A7598.

Descriptors: *Activated sludge, Evaluation, Performance, Statistical methods, Analytical techniques, Sampling, Flow measurements, Biochemical oxygen demand, Dissolved oxygen, *Waste water treatment, *Sludge treatment, *Treatment facilities.
Identifiers: Sludge loading factor, Sludge volume index, Mixed liquor suspended solids, Toronto, Canada.

The difficulty in accurately modeling or scaling various parameters in laboratory scale studies of the activated sludge process has led to attempts to obtain design data from full scale operating plants. It was determined that for this particular test, conducted at the Lakeview Sewage Treatment Plant near Toronto, the flow measurements and sampling procedures applied, as well as the scope of the analytical tests performed were insufficient to provide reliable evaluation of performance. Some interesting results from the study were: (1) simple statistical procedures may greatly improve the extent and quality of information to be drawn from operational data; (2) there seemed to be a total lack of correlation between final effluent BOD and the sludge loading factor; (3) little or no correlation existed between the SVI and the sludge loading factor; and (4) there was an increase of the SVI with an increase in the sludge return rate. The following conclusions were drawn from the study: (1) low plant effluent quality at the Lakeview Plant is due primarily to specific plant influent characteristics; (2) modification of the scope of plant metering and sampling procedures, and expansion of the analytical tests is essential to more fully characterize and explain the performance of the treatment facilities. (Lowry-Texas)
W71-07763

DETERMINATION OF FLOTABLE SUBSTANCES IN WASTE WATER,
Sacramento State Coll., Calif. Dept. of Civil Engineering.
D. J. Hinrichs, K. D. Kerri, and J. Paterson.
Water and Sewage Works, VOL 118, No 3, p 70-74, MAR 1971. 4 FIG, 1 TAB, 3 REF.

Descriptors: *Water analysis, *Flotation, Analytical techniques, Sampling, Stratification, Design criteria, Cost analyses, Economic feasibility, Waste water treatment, *Separation techniques.
Identifiers: Flotable solids, Settleable solids.

The presence of flotable solids in waste water, in the form of films and scums, and the resulting design necessary to remove these flotables from the

surface and convey them to specialized treatment facilities, has created a need for a specific test to determine the amount of flotables present. In response to this need, an apparatus has been built, and a testing procedure developed. The apparatus consists of two Imhoff cones fastened together at the large ends. The total cost of manufacturing such a device in the laboratory was $41.00. There are no chemical costs, and thorough cleaning is the only maintenance required. The unit has no instrumentation and draws no electrical power. The test itself requires a minimum of time to perform. Accuracy is impaired only by the difficulty in obtaining a representative sample, and in keeping the sample mixed before the actual test begins. Collection of a representative sample, however, is a problem pertinent to all waste water examinations, and so should not be included as a drawback for this particular system. Also, the stratification of the sample does not prevent a serious obstacle, since the averaging of several tests will eliminate any inaccuracies due to stratification. (Lowry-Texas)

KINETIC CONSTANTS FOR AEROBIC GROWTH OF MICROBIAL POPULATIONS SELECTED WITH VARIOUS SINGLE COMPOUNDS AND WITH MUNICIPAL WASTES AS SUBSTRATES,
Oklahoma State Univ., Stillwater.
K. M. Peil, and A. F. Gaudy, Jr.
Applied Microbiology, Vol 21, No 2, p 253-256, Feb 1971. 2 fig, 2 tab, 7 ref.

Descriptors: *Kinetic constants, *Aerobic growth, *Biological treatment, Organic waste, Heterogeneity, Growth rate, Sewage, Culture, Waste water treatment.
Identifiers: Substrates, *Microbial populations.

Previous studies by the authors showed that the Monod relationship (U—Um (S)k sub s..S) best describes the growth of heterogeneous populations in a synthetic waste water containing glucose as the sole carbon source and limiting nutrient. This study is to extend on the usefulness of the above idea by testing the applicability of the Monod equation to heterogeneous populations growing on various substrates. 27 sets of experiments were undertaken, 25 with various pure compounds as sole source of carbon and 2 with sewage. The sewage was concentrated at 65C and 55C. The concentrate was slightly alkaline, pH 8.5. Description of the materials and methods used are given. In general hyperbolic curves were obtained in plots of U versus S. A table showing values of Um and K sub s is given. Thus the above study concludes that the hyperbolic function can be used to describe the relation between growth kinetics and substrate concentrations for systems which may be heterogeneous with respect to both species of microbe and carbon sources. LOW-LEVEL RADIOACTIVE WASTE TREATMENTS: THE WATER RECYCLE PROCESS,
Oak Ridge National Lab., Tenn.
W. C. Yee, F. Delora, and W. E. Shockey.
Oak Ridge National Laboratory No ORNL-4472-UC-70-Waste Disposal and Processing. 30 p, 10 fig, 2 tab, 18 ref. AEC Contract No W-7405-eng-26.

Descriptors: *Nuclear power plants, *Water reuse, *Waste water treatment, Water pollution control, Water treatment, Radioisotopes, Detergents, Pilot plants, Ion exchange, Demineralization, Zeta potential, Coagulation, Mixing, Filtration, Membranes, Adsorption, Turbidity.
Identifiers: *Radioactive contaminants, *Decontamination factors.

Re-cycle of water has become increasingly popular, with the atomic energy industry being no exception. A re-cycle process for decontaminating low-level radioactive aqueous wastes and recycling the purified water for re-use at nuclear installations has been successfully developed and demonstrated through several cycles in a micro-pilot plant. The wastes used were ORNL wastes containing low concentrations of salts and radionuclides. The process includes the following steps: (1) clarification; (2) demineralization; and (3) activated carbon treatment. Zeta potential controlled additions of alum, activated silica and nonionic organic polyelectrolyte provided excellent coagulation control. Water in the micro-pilot plant underwent decontamination from all major radionuclides by decontamination factors ranging from 1000 to 10,000 for up to 2400 bed volumes of water. Product water met U. S. Public Health Service Standards for radioactive elements, and the turbidity level of .05JTU is comparable to that of high-quality distilled water. (Lowry-Texas)

MANAGEMENT DECISIONS IN SOLVING WASTE WATER PROBLEMS,
Oscar Mayer, and Co., Asilomar, Calif.
O. Donald Denker.
Water and Sewage Works, Vol 118, No 1, p IW-14--IW-22, Jan 1971. 2 fig, 7 tab.

Descriptors: *Water pollution control, Biochemical oxygen demand, Waste water treatment, Industrial wastes, Biological treatment, Water policy, *Water management (Applied), *Decision making.

Each company should adopt a water pollution control policy headed by a responsible person who has ready access to top management. At Oscar Mayer and Company the general sanitary engineer keeps the management informed by periodical status reports. Samples of such reports are presented. There are four causes for wrong management decisions which are: (1) lack of information, (2) misinformation, (3) information misused, and (4) information not used. Those four causes are discussed with illustrative examples. With environmental pollution control affecting plant site selection, a basic policy for site selection is presented with an illustrative example. Though not economical but for the sake of pollution prevention, continuous rendering processes have been used in place of wet rendering. Water conservation and reuse which could be achieved by better design of water using equipment and improving personnel attitude toward conservation should receive more attention from the management. Oscar Mayer and Company re-uses 3.2 MGD of pretreated water. Waste water stream segregation helps achieve effective pretreatment at least cost. Companies should always look into developing their own secondary treatment prior to negotiation with municipalities. A flow chart of Oscar Mayer and Company's waste treatment plant at Madison, Wisconsin which achieves 93.5% BOD removal is shown. (Rayaan-Texas)

LOW TEMPERATURE CATALYTIC OXIDATION OF WASTE WATER VAPORS,
Aerospace Medical Research Labs., Wright-Patterson AFB, Ohio.
Courtney A. Metzger, Albert B. Hearld, Bobby J. Reynolds, Bobby G. McMullen, and William H. Thomas.
Available from the National Technical Informati Service as AD-715 286, $3.00 in paper copy, $0. in microfiche. Aerospace Medical Resear Laboratories Report No AMRL-TR-68-48. 13 p fig, 6 tab, 2 ref. Project No 6373, TASK 04.

Descriptors: *Water reuse, *Catalysts, *Oxidati *Vapor compression distillation, Urine, Evapo tion, Membranes, Filtration, Ammonia, Micro ganisms, *Waste water treatment, Temperatu Radioisotopes, Electric power demand.
Identifiers: Plate counts, Waste water vapors.

Two low temperature catalytic oxidation systen designed to oxidize waste water vapors a eliminate trace organic entrainment, were studi with regard to future application to waste wa reclamation in space. Formerly, temperatures 1200F were essential to system operation, th precluding such a system on the basis of power d mand alone. With the development of the t systems tested in this work, catalytic oxidation 300F was made possible. Development radioisotope energy for thermal energy also co tributed much towards making catalytic oxidati more feasible both from a power and a weig standpoint. Sterile, high quality water w reclaimed by the catalytic oxidation units, used conjunction with vapor-compression distillati units, and various filtering membranes. Input to t system consisted of urine, washwater, and deh midification. Output rate varied from 546 ml/hr 30 ml/hr during a ten day test. Further research needed on a long term basis to stimulate orbital space flights of extended duration. However, this the first known development of a satisfactory l temperature catalytic unit integrated with vacuum distillation recovery unit, and such a u could possibly have widespread application. N REDUCTION OF WASTE WATER M HOUSEHOLDS,
ral Dynamics Corp., Groton, Conn. Electric Div.
ley, and H. Wallman.

Water and Sewage Works, Vol 118, No 3, p 68-70, Mar 1971. 4 fig, 8 ref.

Descriptors: *Water conservation, *Water re-use, Waste water treatment, Domestic wastes, Technical feasibility, Cost analysis, *Water utilization, Disinfection.
Identifiers: Bathing.

Various sources were utilized to establish a water use pattern for an average American family of 2 adults and 2 children. 70% of the total household water intake is consumed in toilet flushing and bathing. Therefore, since this is the largest single area of water use, the greatest savings from applied conservation techniques should be accomplished here. Several plumbing innovations that reduce the amount of water required to transport waste products from the home are presented, as well as water-conserving devices for showers and washing machines. A cost analysis revealed, however, that water re-use within the individual home unit is not economically feasible. Water conservation, then, is important in reducing the total volume of flow which requires extensive treatment, thereby easing the burden on many overloaded treatment facilities. The following conclusions were drawn from the preceding study: (1) currently available water saving devices can reduce waste flows from 30 to 50% at little additional cost to the homeowner; (2) limited surveys indicate general public acceptance of such devices; and (3) complete waste treatment and water re-use on a single unit scale does not appear to be practical at this time. (Lowry-Texas)

ANAEROBIC SLUDGE DIGESTION, MESOPHILIC-THERMOPHILIC,
Western Kentucky Univ., Bowling Green.
D. R. Rowe.
Water and Sewage Works, Vol 118, No 3, p 74-76, Mar 1971. 2 fig, 1 tab, 8 ref.

Descriptors: *Anaerobic digestion, *Temperature, Methane bacteria, Microorganisms, *Sludge digestion, Alkalinity, Hydrogen ion concentration, Acidity, Nitrates, Nitrites, Ammonia, Methane, *Waste water treatment.
Identifiers: Volatile solids, Volatile acids.

Four laboratory scale anaerobic digesters were operated for a 4 week period. Two digesters were operated in thermesophilic range (35C), and two were operated in the thermophilic range (55C) to determine the temperature effects. The progress of digestion was evaluated by the volume of gas produced and by the decrease in volatile solids and the increase in fixed solids. pH, total solids, volatile solids, nitrate, nitrite, ammonia, alkalinity, and volatile acid analyses were performed on the sludge samples, and all determinations were made in accordance with Standard Methods. Overall results showed a higher rate of digestion taking place in the thermophilic digesters. Also, the thermophilic organisms were shown to be more efficient in the removal of nitrate and nitrite nitrogen. The increased efficiency of thermophilic digestion proved that satisfactory results could possibly be obtained in 7-15 days instead of the usual 24-26 days presently used in mesophilic digestion. Therefore, heating of the digesters to the thermophilic range could effectively double the digester capacity of an existing plant without additional construction. (Lowry-Texas)

RECLAMATION OF POTABLE WATER FROM DOMESTIC SEWAGE,
Ontario Research Foundation, Toronto.
F. Besik.
Water and Pollution Control, Vol 109, No 4, p 46-48, Apr 1971.

Descriptors: *Water re-use, *Separation techniques, Reverse osmosis, Activated carbon, Domestic wastes, Adsorption, Filtration, Ion exchange, Bacteria, Disinfection, Colloids, Chemical oxygen demand, Biochemical oxygen demand, Temperature, Odor, Taste, Color, Turbidity, Oxidation, *Waste water treatment, *Potable water, Sewage.

Production of potable water from domestic sewage must include the following steps: (1) separation of suspended and colloidal matter below 5-1 Jones Turbidity Units; (2) removal of dissolved inorganic solids to below 500 mg/l; (3) reduction of soluble organic carbon material to below 0.2 mg/l; (4) removal of toxic compounds and biocides to within the range of .001-5.0 mg/l; (5) reduction of product temperature to below 15C; (6) elimination of odors, tastes, and colors to limits acceptable to Canadian Drinking Water Standards; and (7) removal of bacterial contamination through adequate disinfection. At the present time, technology has advanced to the point where all of the above limitations can be met through the utilization of available processes. However, being technically feasible does not mean that these processes are also economically feasible at the present time. Tables included give itemized listings of the various constituents of domestic sewage, along with the per capita contribution of many common pollutants. (Lowry-Texas)

PAPER MILL WASTE: TREATMENT FOR COLOR REMOVAL,
Continental Can Co., Inc., Hodge, La.
Edgar L. Spruill.
Water and Sewage Works, Vol 118, No 3, p IW/15-IW/25, Mar 1971. FWQA Grant No 12040 DRY.

Descriptors: *Color, *Lignins, Pulp and paper industry, *Pulp wastes, Fibers (Plant), Turbidity, Chemical precipitation, Calcium carbonate, Lime, Sludge, Filtration, Industrial wastes, *Waste water treatment.

The Kraft pulping process separates lignin from wood cellulose and results in the production of black liquor. This black liquor is not effected by even the most thorough bio-oxidation processes. Alternative treatment methods have been studied. Lime precipitation has been given special attention because of the possibility of recovering it through the pulp mill chemical system. Several variations of lime precipitation were experimented with before the accidental discovery that water containing fiber 'fines' provided good flocculation and removal at moderate lime dosages. Experiments on a wide variety of colored process waste water showed the lime requirements to vary almost, but not quite, directly as the effluent color varied. After color precipitation, the resultant clarified liquid contained nearly half of the lime used. This liquid was reacted with CO2, from kiln stack gas to recover the calcium as calcium carbonate. Recarbonization neutralized the final effluent. The sludges were all processed through the lime kiln, the fiber-lignin sludges burned, and the remaining lime recovered. (Lowry-Texas)

Journal, New England Water Works Association, Vol 85, No 1, p 10-24, Mar 1971. 6 fig, 3 ref.

Descriptors: *Waste water treatment, *Sludge, Water treatment, New England, Water softening, Coagulation, Flocculation, Sedimentation, Chemical precipitation, Filtration, Centrifugation, Vacuum drying, Freezing, De-watering, Lime, Nutrients, Iron, Manganese, Hardness, Sewers.

The main sources of wastes from water treatment plants include: (1) filter backwash water; (2) coagulation process sludges; (3) softening sludges; (4) sludges from iron and manganese removal plants; (5) diatomaceous earth filtration sludges; and (6) ion exchange brines. For the sludge to be

disposed of in landfill areas, it must first be dewatered. The popular cut-off for dewatering processes is 20% solids and a process which cannot concentrate the sludges to 20% solids has no possibility of commercial use. The process achieving the greatest volume reduction at the present time is freezing of the sludge. This method has been successfully used in Copenhagen since 1963. Laboratories in the United States have reported volume reductions of as much as 86% after the first freezing, with further reductions possible with repeated thawing and re-freezing. Seven other possible disposal methods are; (1) lagoons; (2) drying beds; (3) direct discharge to a sanitary sewer; (4) centrifugation; (5) sludge pressing; (6) vacuum filtration; and (7) alum recovery. No one of these methods is universally applied. In each instance, the particular task to be accomplished, and the economics involved must be carefully considered before a process is selected. DILUTION OF AN INDUSTRIAL WASTE EFFLUENT WITH RIVER WATER IN THE VADOSE REGION DURING PIT RECHARGE,
Arizona Water Resources Research Center, Tucson.
L. G. Wilson, P. S. Osborne, and D. J. Percious.
Office of Saline Water, Grant 14-01-0001-630.
American Society of Agricultural Engineers, 1968 Winter Meeting, Chicago, Illinois. Meeting Paper No 68-727. 26 p , 8 fig, 3 tab, 10 ref.

Descriptors: *Artificial recharge, *Waste dilution, *Pit recharge, *Water reuse, *Vadose water, Profiles, Potable water, Water quality, Chemical analysis, Groundwater recharge, Pollution abatement, Monitoring, Mixing, Waste disposal, Seepage, Pumping, Salinity, Dispersion, Ephemeral stream, Hydrographs, Industrial wastes, Effluent streams, Water conservation, Waste water disposal, Water management (Applied), Cooling water, Arizona, Arid lands.
Identifiers: *Dilution potential, *Recharge mounds, *Water-content profiles, Recharge trials, Santa Cruz River (Ariz).

Artificial recharge of waste water may conserve water resources in arid lands. Undiluted blowdown effluent (1000 to 2000 mg/l total dissolved solids--TDS) from industrial cooling towers supplied 15 pit recharge trials from May to August 1968 into 80-foot thick vadose alluvium. Water-content profiles and groundwater hydrographs were observed near the recharge site and the abutting ephemeral stream, the Santa Cruz River (Arizona). The water level below the stream averaged 70 feet. The total quantity of effluent recharge was 40 acre-feet. Dilution of pit-recharged effluent and residual water (700 mg/l TDS) did not occur in the vadose region prior to summer streamflow (400 mg/l TDS), though dilution ensued in downstream groundwater, and in the phraetic region. Pit-recharged effluent was not diluted with streamflow recharge because of high heads in the effluent. After trials, streamflow recharge mixed with the effluent producing lower salinities during the pumping operation. Dilution potential of influent seepage is useful in waste disposal or artificial recharge when in place mixing may replace above ground mixing facilities. Recharging of highly concentrated waters should coincide with periods of fully developed river recharge mounds and/or when ephemeral streams are discharging. Pumping as a mixing and blending procedure should be evaluated. Water-quality monitoring is necessary to avoid potable groundwater contamination. (Popkin-Arizona)

OZONATION, NEXT STEP TO WATER PURIFICATION,
Rene J. Bender.
Power, Vol 114, No 8, p 58-60, Aug 1970. 4 fig.

Descriptors: *Ozone, *Water purification, *Waste water treatment, Oxidation, Chlorination, Storm runoff.
Identifiers: *Overflow purification, Philadelphia.

Ozonation is an outstanding method for purifying water, because ozone is a superior oxidizing agent and oxidation helps clean water thoroughly. Workings of the two types of ozonators are diagrammed and described. Ozonation is not yet used in the U.S. to purify municipal drinking water because most state laws demand that chlorination be used. Ozonation does not replace chlorination, but it incorporates chlorine into its process in two forms. Ozonation kills bacteria and viruses faster than does chlorination; in addition, ozone does not affect water taste, and it eliminates the slight chlorine taste introduced during primary treatment. Ozonation costs about twice as much as chlorination, but both are very inexpensive. A U.S. trend is now towards ozonation of waste water, and one pilot plant in Philadelphia is designed to purify combined sewer and stormwater discharge when flash floods cause untreated water and sanitary sewage to overflow into rivers. Additional uses of ozone in connection with wastewater are mentioned.

FIRESTONE INSTALLS POLLUTION CONTROL.

Oil Gas J, Vol 68, No 35, p 79, Aug 31, 1970.

Descriptors: *Water pollution control, *Treatment facilities, Control systems, Concrete construction, Separation techniques.
Identifiers: *Industrial treatment, *Storm water treatment.

A water pollution control system, which separates storm and industrial effluent and treats plant waste water before release into the bayou, is being installed. This $8.8 million operation provides the Firestone plant with a separate industrial effluent collecting system and a separate storm water collecting system, thus the possibility of flushing the two systems together during a heavy rainfall is eliminated.

A PHYSICAL - CHEMICAL SYSTEM FOR TREATMENT OF COMBINED STORM SEWAGE.

Committee on Sewerage and Sewage Treatment, Ralph Stone (Chairman) J Sanit Eng Div, Am Soc Civil Engrs, Vol 96, No SA4, Proc Paper 7477, p 993-994, Aug 1970.

Descriptors: Water pollution control, *Sewage treatment, *Activated carbon, *Pilot plants, Laboratory tests, *Waste water treatment.
Identifiers: *Storm sewage.

This is a report on ongoing research, conducted by A. J. Shuckrow, G. W. Dawson, and A. T. Brix, covering enumeration and evaluation of the factors which should affect decisions as to the degree of water pollution control required in each specific situation. Powdered activated carbon may be utilized in a physical-chemical process for the treatment of combined storm sewage. The program involves laboratory development of the process, design and construction of a 100,000 gpd mobile pilot plant, and demonstration of the process. The process involves contacting the waste water with powdered activated carbon and subsequent coagulation with alum and a polyelectrolyte followed by high-rate tube settling. The process appears to meet the following desirable characteristics for treatment of combined storm sewage: short detention time, intermittent use with capability to tolerate widely fluctuating flows and waste water composition, small space requirements, high quality effluent, and economical operation. Based on the laboratory findings, the mobile pilot plant is being designed to fit into a standard forty-foot trailer van with the exception of the carbon regeneration facility, which will be skid mounted. The system is designed for maximum operational flexibility and includes turbidity, pH, and flow measuring instruments in addition to the continuous organic carbon analyzer.

orption of phenol from aqueous solutions on
s varying in surface energy was studied using
mers as adsorbents. The amount of phenol ad-
ed on silica, carbon, nylon, polyethlene, and
on was measured over a wide range of concen-
ons. The temperature dependence of adsorp-
was established in the case of carbon. Surface
measure measurements, infrared spectra, and
act angle measurements were used to better
e the factors effecting phenol adsorption. The
ce areas of Cab-O-Sil, Graphon, Aviamide,
hon, Microthene, and Teflon were 223, 87,
0.10, 0.35 and 8.5 sq m/gm, respectively, mea-
d by either low temperature nitrogen or kryp-
adsorption. The critical surface tensions of
othene, Alathon, and Teflon were 35, 31.5,
28 dynes/cm, respectively. The value for
on was anomalously high. The multiple internal
ction infrared spectrum of Microthene showed
adsorption bands than Alathon. No signifi-
temperature dependence was noted in the ad-
ion of phenol on carbon. The amount of
ol absorbed per unit area by the solid in-
ses as the surface energy of the solid decreases.

NEW TECHNOLOGY FOR TREATMENT OF WASTE WATER BY REVERSE OSMOSIS,
Envirogenics Co., El Monte, Calif.
B. S. Fisher, and J. R. J. Lowell.
Copy available from GPO Sup Doc as EP2.10; 17020DUD 09/70, $0.70; microfiche from NTIS as PB-199 362, $0.95. EPA Report 1-66, Sep 1970. EPA Program No 17020DUD, Contract No 14-12-553.

Descriptors: *Reverse osmosis, *Separation techniques, Desalination processes, Demineralization, Semi-permeable membranes, Membranes, Cellulose, Phosphates, Nitrates, Temperature, Chemical oxygen demand, Pressure, Tertiary treatment, *Waste water treatment.
Identifiers: *Flux, Total dissolved solids.

Stable, high-flux membranes for waste water renovation by reverse osmosis were required to meet or exceed: (1) fluxes greater than 60 gal/sq ft/day with no more than a 20% increase after one year; (2) rejection of 60% of sodium chloride; and (3) rejection of 90% of sodium sulfate. All testing was performed at 600 psi, with 1000 ppm feed solutions. These specifications were met by three cellulose based membranes. Flux losses over short periods were extrapolated to yearly values and ranged from 12-18%. However, periodic cleaning with a laundry enzyme pre-soak was necessary as the flux rates initially declined very rapidly. Cleaning restored the membranes to 80 to 90% of the initial values. Daily cleaning maintained a five day series of tests at nearly constant levels. The best of the three membranes tested rejected 90 to 97% of TDS, 70 to 100% of COD, 86 to 96% of ammonium ion, 72 to 99% of nitrate ion, and 97 to 99% of total phosphate. Techniques were explored for attachment of proteolytic enzymes to cellulose acetate membranes to render them resistant to colloid fouling. The proteolytic enzyme trypsin was chemically attached to the active layer surface of a membrane prepared from the N-hydroxysuccinimide ester of cellulose acetate hydrogen succinate. The resulting enzymatic membrane displayed hydrolytic activity. No cost estimates were presented for this type of treatment process. (Lowry-Texas)

PHOSPHATE STUDY AT THE BALTIMORE BACK RIVER WASTE WATER TREATMENT PLANT.
City of Baltimore, Md.

Copy available from GPO Sup Doc as EP2.10; 12010DFV 09/70, $1.50; microfiche from NTIS as PB-199 363, $0.95. EPA Report, Sep 1970. 158 p, 16 tab, 33 fig, 14 ref. EPA Program No 12010DFV, Contract No 14-12-471.

Descriptors: *Phosphates, *Activated sludge, Automatic control, Design criteria, Monitoring, Analytical techniques, Sampling, Hydrogen ion concentration, Turbidity, Nitrogen, Chemical oxygen demand, Dissolved oxygen, Oxidation reduction potential, Data processing, Baffles, Aeration, Mixing, Chemical precipitation, Municipal wastes, *Waste water treatment.
Identifiers: Baltimore (Md).

High levels of phosphorus removal have been observed at the Baltimore Sewage Plant in the past. A six month study of the operating conditions and design parameters of two parallel, 10 MGD activated sludge systems was conducted in an attempt to establish the mechanism by which the phosphate was removed. The following variables were used: suspended solids concentration, waste water flow, aeration basin mixing configuration, and dissolved oxygen levels. Both mixing and dissolved oxygen were shown to influence the process greatly. Contact stabilization or step aeration, as opposed to plug flow, caused sharp decreases in the removals, while low dissolved oxygen levels stimulated releases of phosphorus from the sludge. Operating conditions which enhance phosphate removal are standard conditions now at the Baltimore plant. Phosphate removal at Baltimore averaged 82%, compared with 15 to 20% removals for conventional activated sludge, and 9% in Baltimore's trickling filter. No costs analysis was undertaken, since complete removal of the phosphorus involves removal from the sludge supernatant. Some of the parameters which may lead to enhanced phosphate removals have been demonstrated. However, the exact reaction or mechanism by which the removals proceed is still unknown, even though it was established that the calcium removed from the system was not principally by precipitation. (Lowry-Texas)
W71-07991

THE BACTERICIDAL EFFECT OF LIME FLOCCULATION/FLOTATION AS A PRIMARY UNIT PROCESS IN A MULTIPLE SYSTEM FOR

THE ADVANCED PURIFICATION OF SEWAGE WORKS EFFLUENT,
National Inst. for Water Research, Pretoria (South Africa).
W. O. K. Grabow, Nora A. Grabow, and J. S. Burger.
Water Research, 1969, Vol 3, p 943-953. 6 fig, 1 tab, 25 ref.

Descriptors: *Disinfection, *Bactericide, Hydrogen ion concentration, Alkalinity, Lime, Flotation, Flocculation, Coagulation, Water re-use, Temperature, Analytical techniques, Separation techniques, Sampling, Bacteria, E. Coli, *Waste water treatment.
Identifiers: *Plate counts.

To determine the bactericidal effect of lime in the flocculation/flotation unit under investigation, survival times were recorded for: (1) pure cultures of selected bacterial strains exposed to lime in membrane-filtered humus tank effluent (HTE); (2) the bacterial population naturally occurring in HTE exposed to lime in raw HTE; and (3) the bacterial population naturally occurring in HTE exposed to lime in the flotation unit. Reductions occurring in the reactor itself are attributed both to the bactericidal action of lime, and physical removal in coagulation and flocculation. Bacterial reductions of as high as 98% were recorded. Although coliform organisms were reduced 98%, faecal streptococci and staphylococci were reduced only 95.0 and 93.3% respectively under the same conditions. Maintaining the pH at 11.5 for 60 minutes reduced the plate count of the normal mixed culture by 99.0%. Factors affecting the effects of the flotation unit include: (1) presence of organic material; (2) the physiological state of naturally occuring bacteria differs from that of organisms grown in 24 hour broth cultures; (3) temperature increases directly increase the bactericidal effect of the lime; and (4) structure of the bacterial cell wall seems to influence the amount of reduction. In an actual treatment situation, the Lime Flotation/Flocculation will provide not only particulate removal, but high alkalinity will reduce bacterial levels as well. (Lowry-Texas)

THE VIROLOGY OF WASTE WATER TREATMENT,
National Inst. for Water Research, Pretoria (South Africa).
W. O. K. Grabow.
Water Research, 1968, Vol 2, p 675-701. 147 ref.

Descriptors: *Public health, *Viruses, *Waste water treatment, Epidemiology, Activated sludge, Filtration, Adsorption, Hydrogen ion concentration, Temperature, Flotation, Disinfection, Viricides, Ozone, Chlorination, Oxidation, Ultraviolet radiation, Environmental sanitation.
Identifiers: South Africa.

Virology has just recently been endowed with the tools necessary to conduct epidemiological investigations. Within the last 30 years, the development of the electron microscope and of tissue culturing techniques have stimulated interest and concern in the transmission of viruses. Sampling procedures and isolation techniques are presented as background for examining the virology of waste water treatment plants. Examinations have revealed that little or no virus removal takes place in primary settling tanks with detention times of 3 hours or less. Flocculation could possibly concentrate the viruses in the floc, but although as much as 99.6% virus removal has been observed in the laboratory, operating conditions in most plants would preclude efficiencies in that range. Little information has been compiled with regard to viral removals in trickling filters, but the information that is available indicates that little or no removal takes place. Activated sludge data, however, indicates significant antiviral activity, with up to 98% reduction of certain coxsackie viruses. Stabilization ponds and activated carbon demonstrated little effect on viruses, while sand filtration, for many reasons still unknown, removed nearly all viruses from an inflow of 20,000 PFU/ml during a 7 month investigation. Disinfection with chlorine, iodine, ozone, and ultraviolet radiation was also investigated, with ultraviolet radiation being technically, if not economically, feasible for the job. Viruses are becoming more important in our environment, and much further research is needed for their control. (Lowry-Texas)

WASTE WATER TREATMENT IN GREAT BRITAIN,
Commonwealth Associates, Jackson, Mich.
Robert J. Grant.
Water and Sewage Works, Vol 117, No 8, p 266-270, Aug 1970. 3 fig, 8 ref.

Descriptors: *Water quality control, *Waste water treatment, Domestic wastes, Industrial wastes, Sewage treatment, Tertiary treatment, Activated sludge, Trickling filters, Filtration, Flocculation, Adsorption, Ion exchange, Reverse osmosis, Nutrients, Sludge, Dewatering, Centrifugation, Incineration, Organic loading, Cost analysis, Storm runoff, Climatic conditions.
Identifiers: *Great Britain.

65% of the domestic sewage of Great Britain is treated and discharged to inland water courses, while the remaining 35% is discharged directly to estuaries or the sea, receiving little or no treatment. Analytical tests performed are those recommended in 'Standard Methods', with few exceptions. Waste water constituents of Britain's domestic sewage differ from those of the United States, because of the difference in diet. Activated sludge, Pasveer oxidation ditches, and low rate trickling filters comprise the bulk of the widely accepted secondary treatment methods. Tertiary treatment methods include microstraining, slow and rapid gravity sand filtration, land irrigation, lagooning and upflow pebble bed clarfiers, while flocculation, foaming, adsorption, reverse osmosis, and electrolysis are in the experimental stage. Sludge treatment has traditionally been accomplished with drying beds. Lack of land has stimulated much interest in mechanical dewatering devices, namely pressure or vacuum filtration, polyelectrolyte conditioning, heat treatment, and wet oxidation, and incineration. Problems associated with waste water treatment are not experiencing the same rapid solutions as other technological problems. More effective control and reclamation practices are needed to avoid serious environmental problems, and progress which has been slow up to now must begin to speed up if the environment is to be saved. (Lowry-Texas)

A SOLUTION TO THE PHENOLIC PROBLEM IN FIBERGLASS PLANTS,
Johns-Manville Research and Engineering Center, Manville, N.J.
J. M. Baloga, F. B. Hutto, Jr., and E. I. Merrill.
Water and Sewage Works, Vol 118, No 3, p IW/7-IW/11, Mar 1971. FWQA Grant No WPRD87-01-68.

Descriptors: *Water reuse, *Phenols, Industrial wastes, Flow rate, Turbidity, Toxicity, *Filtration, Separation techniques, Hydrogen ion concentration, *Waste water treatment, New Jersey.
Identifiers: *Fiberglass, Suspended solids.

Phenolic resin is used as a binder in the manufacture of fiberglass. Conveyor belts must be flushed with water to prevent this phenolic resin from rendering them inoperable. From this washing operation, 80% of all phenol discharges are originated. The Johns-Manville Co. has developed a process for eliminating phenolic discharges by reusing phenolic wastes in the plant after filteri them to remove the suspended solids which wou otherwise foul the equipment. A small-scale test the filtration system was conducted. The syste consists of a scrap pump, a primary filter, a diatomite pressure filters. Flow rate to the filters 75 ppm with influent turbidity of 12 mg/l. Efflue turbidity is reduced to 1 to 2 mg/l, eliminating t possibility of the solids fouling equipment duri subsequent reuse. Quality of the receiving wat has dramatically improved, while water use for t plant has been reduced more than 50%. Produ quality has not been impaired by reusing the f tered process waters. Net cost savings $2700/month have been realized over a 4 mon period, attributed mainly to reduction of bind usage by the amount which is recirculated in the f tered water. (Lowry-Texas)

METROPOLITAN BOSTON'S WASTE WATE QUALITY CONTROL PROGRAM,
Massachusetts Metropolitan District Commissio Boston.
Francis T. Bergin.
Water and Sewage Works, Vol 117, No 9, p 30 304, Sept 1970.

Descriptors: *Water quality control, *Sewa treatment, Sewers, Tunnels, Design criteria, Se mentation, Chlorination, Disinfection, Sludg Scum, Methane, Anaerobic digestion, Incinerati Massachusetts, *Waste water treatment.
Identifiers: *Boston (Mass).

The early 1900's saw the city of Boston in a po tion of leadership in the waste water manageme area. Failure to keep enlarging their facilities response to population growth, however, generat unsanitary conditions which resulted in Bost Harbor becoming a large, unhealthy cesspool the early 1950's. Today, almost twenty years aft being ordered to undertake a multi-million doll pollution control program, Boston has two tre ment plants, one at Deer Island and one at N Island, have a combined capacity of 1036 mg These plants provide only primary treatment, wi supernatant from the sedimentation basins rece ing chlorine before being released on the outgoi tide. Sludge and scum are removed, concentrate and digested in floating cover, closed digeste Digester gas produced is used as a power source the plant for the pumps and aeration blowers. T second phase of the waste water management pl includes the construction of numerous rel sewers, and of several deep tunnels. The sew bring collected waste water to the tunnels where is screened and degritted prior to discharge to t downtake tunnels. Relief sewers vary in size fr 27 in to 135 in, with approximately 11 miles of 10 to 10.5 ft diameter tunnels to collect flow from t relief sewers and convey it to one of the treatme plants. A 233 mgd storm detention and chlorin tion tank with an expected usage of 22 times yea has been included to prevent untreated by-pass The construction of this sewerage system has lowed re-opening of beaches, shellfish, harvesti bed and recreational areas. Much has been acco plished, but much remains to be done. (Lowry-Te as)

BIOLOGICAL TREATMENT OF BLEAC PLANT WASTES,
Prince George Pulp and Paper Ltd. (British Colu bia).
G. E. Charles, and G. Decker.
Journal Water Pollution Control Federation, V 42, No 10, p 1725-1739, Oct 1970. 5 fig, 6 tab, ref.

Descriptors: Pulp and paper industry, *Industr wastes, Water quality control, Salmon, Toxici Design criteria, Activated sludge, Neutralizatio Oxygenation, Temperature, Hydrogen ion conce tration, Biochemical oxygen demand, Aeratio Dissolved oxygen, Nutrients, Phosphates, A

ia, Lime Slurries, Cost analysis, *Biological tment, *Pulp wastes, *Waste water treatment.
tifiers: *Bleach plant wastes, Seeding, Fraser er, BOD5, Canada.

ada's Fraser River is a major salmon producing ershed. When several pulp and paper mills were t, effluent standards were immediately set ch included: (1) an aerated basin of 5 day re- ion time; (2) 60% BOD5 removal; (3) max- m effluent BOD5 of 80 mgl, and (4) effluent ed to 65% concentration with river water shall cause mortality to yearling salmon in a 96 hour od. A low-rate activated sludge treatment em consisting of neutralizing, seeding, and ting was chosen for bleach plant wastes, with combined system having a detention time of 24 s. A two year study indicated that both BOD toxicity levels were within the stipulated limits the exception of several periods of upset of the em. Unscheduled shut downs were found to ease the load on the system enough to upset peration after loading resumed. This problem solved by the addition of ammonium phate to the system at a reduced rate. Nutrient tions were alos found to be necessary, with the of BOD5 removed to nitrogen to phosphorus 00 to 5 to 1 found to achieve the best results. A residual of 0.5 mg/l was maintained at all s to facilitate biological treatment. The treat- t costs for the system averaged $1.40/ton of uct, the bulk of which goes toward neutraliza- and nutrient addition. (Lowry-Texas)

ifiers: *Tannins, *Polymerization, Substrate, l organic carbon, Matrices, Floc, Frank, Par-

tch fed biological reactor, using sludge previ- acclimated, was used to study the egradability of chestnut, wattle, and racho tannins. Warburg experiments showed hibitory effects for tannins in concentrations to 1.5% at pH 7.5. At pH 5.5, however, in- ory effects were detected at concentrations e 1.25% for non-acclimated sludges. Warburg riments also established the fact that during ration, the organisms utilized non-tannin car- as substrate, and not the tannins themselves. ins, as measured by shake-culture experi- s and Warburg experiments, are not movable. Decreases in concentration of tan- in a biological reactor are attributed to three rs: (1) quinone polymerization due to autoox- n; (2) adsorption onto the biological floc; and recipitation. Biological activity has no effect the color of any of the three tannins tested. tnut tannin, containing 42% bio-removable n, has the maximum bio-removable carbon, wattle and quebracho following in that order. ever, since tannins are not biodegradable, vals in a biological system must be accounted y adsorption on the surface of the floc matrix. ry-Texas)

FROM PROBLEM TO SOLUTION WITH ABS POLYMER WASTE WATER,
Borg-Warner Chemicals and Plastics Group, Washington, W. Va.
D. M. Robinson, and Dennis R. Bolten.
Proceedings, Ontario Industrial Waste Conference, 17th, Niagara Falls, Ontario, p 11-29, June 7-10, 1970. 9 ref.

Descriptors: *Industrial wastes, Chemical wastes, *Plastics, Sampling, Pilot plants, Design criteria, Activated sludge, Aeration, Sludge, Biochemical oxygen demand, Chemical oxygen demand, Hydrogen ion concentration, Analytical techniques, Engineering education, Personnel, *Waste water treatment, *Alkylbenzene sulfonates, West Virginia.
Identifiers: Extended aeration, Treatability studies.

Acrylonitrile-Butadiene-Styrene (ABS) plastics were first introduced in 1948, and were developed and marketed in the late 1950's by Marbon Chemical Division at the Borg-Warner Corp. The manufacturing plants were originally built with facilities for solids removal and pH control. When it became evident that secondary treatment was imperative, a comprehensive sampling program was initiated to monitor: (1) pH; (2) free and total acidity; (3) chlorides; (4) sulfates, (5) suspended, dissolved, and total solids; (6) BOD; and (7) COD. This sampling program was the first step in a four step plan which also included: (1) determination of biodegradability; (2) bench and pilot scale studies to supply information for secondary system process design and (3) preparation of process design. A pilot plant having an aeration basin of 10,000 gallon capacity was operated to supplement lab scale data in developing design equations. The plant was then designed according to these design equations, and has been operating satisfactorily. From this work, two important conclusions were drawn: (1) close co-operation with regulatory agencies benefits both parties; and (2) proper consideration must be given to the education of all operating personnel with regard to environmental protection. TREATMENT OF DISTILLERY WASTES-A CASE HISTORY,
Corby Distilleries Ltd., Corbyville (Ontario).
F. H. Bellstedt, and R. K. Nethercott.
Proceedings, Ontario Industrial Waste Conference, 17th, Niagara Falls, Ontario, p 30-41, June 7-10, 1970.

Descriptors: *Industrial waste, *Activated sludge, Aeration, Sludge, Toxicity, Copper, Hydrogen ion concentration, Lime, Fermentation, Chemical oxygen demand, Biochemical oxygen demand, Nutrients, *Waste water treatment.
Identifiers: *Distillery wastes, *Shock loading, Canada.

The distillation of various grain mashes at Corby Distilleries produced effluents from several sources. These effluents, some of which were concentrates of the original effluent, averaged 600 ppm BOD, 900 ppm COD, 11 ppm nitrogen, and 2.7 ppm of phosphates. The wastes had a pH of 3.5-4.0, but after neutralization, the wastes were found to be amenable to activated sludge biological treatment. After further laboratory and pilot plant analyses, including tests dealing with the presence of copper in the waste water, the treatment plant was designed to include the following: (1) a cooling tower for clean hot wastes handling up to 1170 Imperial Gallons per minute; (2) a cooling and recycling station for polluted hot wastes sized for 700 IGPM; (3) a second station equipped with a sump having an agitator, pH controlled lime feed, and nutrient feed pumps; (4) an aeration basin sized for 200,000 IGPD, 24 hour detention time, and with 2 mechanical aerators transferring 83 lbs O2/hr; (5) a rectangular clarifier; (6) a 4 ft deep, 1.02 surface acre lagoon providing a 5 day detention time. This system consistently produces an effluent between 30 and 60 ppm COD, 10 ppm BOD or less, and requires no pH adjustment through the plant, and only 11 ppm nitrogen and 2 ppm of potash for nutriential adjustment. The plant provides a good quality of effluent and shows good resilience in periods of overloading. (Lowry-Texas)

REVERSE OSMOSIS-A REVIEW OF ITS APPLICATIONS TO WASTE TREATMENT,
Ontario Research Foundation, Sheridan Park.
A. Golomb, and F. Besik.
Ontario Industrial Waste Conference, 17th, Niagara Falls, Ontario, p 67-96, June 7-10, 1970. 22 fig, 22 ref.

Descriptors: *Reverse osmosis, *Separation techniques, Water purification, Permeability, *Membranes, Water reuse, Desalination, Industrial wastes, Chemical wastes, Mine drainage, *Waste water treatment, Membrane processes.
Identifiers: Ultrafiltration, Flux, Power requirements.

Reverse osmosis membrane systems are currently classified in 5 major categories: (1) tubular units; (2) spiral-wound units, (3) plate and frame reverse osmosis units; (4) plate and frame ultrafiltration units; and (5) hollow fibre units. A brief description of each type of unit is presented along with its advantages and disadvantages. Reverse osmosis (and/or ultrafiltration units) have been successfully applied in the treatment of: (1) spent liquors from the pulping industry; (2) acid mine drainage waters; (3) petrochemical complex waste waters; (4) electroplating waste waters; (5) cheese whey waste streams; (6) corn processing effluents; (7) high salinty irrigation return flows; and (8) various other miscellaneous industrial waste treatment applications. The principal advantages of reverse osmosis units lie in the low power or fuel costs, as opposed to distillation. Continuing research in this area should inevitably result in better membrane materials and decreased cost, making possible the addition of even more areas to the ever growing list of areas of application. A NOVEL ION EXCHANGE PROCESS FOR CHEMICAL RECOVERY AND POLLUTION ABATEMENT,
Ontario Paper Co., Ltd., Thorold.
D. Craig, and C. D. Logan.
Proceedings, Ontario Industrial Waste Conference, 17th, Niagara Falls, Ontario, p 98-108, June 7-10, 1970. 3 fig, 4 ref.

Descriptors: *Industrial wastes, *Pulp and paper industry, Separation techniques, *Water reuse, Ion exchange, Resins, Adsorption, Chemical precipitation, Sedimentation, Fermentation, Alcohols, Acids, Automatic control, Chemical wastes, *Waste water treatment.
Identifiers: Sodium hydroxide, Regeneration.

The Ontario Paper Company, Limited has used recovery methods to reduce the amount of pollutants discharged from heir pulping processes. In 1943, they pioneered the production of ethyl alcohol from spent sulfite liquors in North America, and today remove in excess of 25 tons of fermentable sugars/day. In 1952, vanillin productionas begun in order to utilize the lignin present in process wastes. At present, the company is involved in a three phase development program to reduce suspended and dissolved solids in the effluent. These three steps include: (1) a 105 inch diameter settler removing 11 tons of suspended solids per day; (2) an ion exchange process; and (3) construction for evaporation and burning of the effluents. Total cost of the project is $8.6 million.

The ion exchange process involves 4 steps: (1) adsorption of alkaline vanillin process liquor in an upflow ion exchange bed at Amberlite IRC-50; (2) water washing of the resin to free it of the liquor; (3) regeneration of the resin with sodium bisulphite and sulphurous acid to elute the Na and restore the resin to its hydrogen form; (4) water washing to displace the regenerant. The three column system is totally automatic, and it can recover 30 ions/day of equivalent NaOH for subsequent in-plant reuse. Additional capacity for up to 65 tons/day recovery is available in response to increased demand. (Lowry-Texas)

MINEWATER TREATMENT-INCO SUDBURY DISTRICT OPERATIONS,
International Nickel Co., of Canada Ltd., Toronto (Ontario).
C. Ferguson, and M. Morris.
Proceedings, Ontario Industrial Waste Conference, 17th, Niagara Falls, Ontario, p 119-132, June 7-10, 1970. 10 fig, 3 ref.

Descriptors: *Acid mine water, *Sulfides, *Mine drainage, Leaching, Chemical precipitation, Lime, Sedimentation, Baffles, Sludge, Copper, Iron, Ponds, Water pollution control, Nickel, *Waste water treatment, Standards.
Identifiers: Water quality standards, Sudbury (Ontario), Canada.

The International Nickel Company has 9 operating mines, four concentrators, two smelters, an iron ore recovery plant, and a copper refinery in the Sudbury area. The output of these mines is 95,000 tons per operating day. Waters contacting the orebody leach out base metal sulphides, primarily copper, nickel, and iron, resulting in acid mine water. Criteria for discharge of mine water is 1 mg/l, 1 mg/l, and 17 mg/l of copper, nickel, and iron, respectively, with a pH to range from 5.5 to 10.6. To produce water consistent with the standards set by the Ontario Water Resources Commission, various treatment schemes have been developed and tested. The advent of hydraulically placed cemented backfills solved many settling problems, but produced sludge handling problems as well due to a greater volume of sludge. Chemical treatment was also required to reduce the dissolved metals in solution to acceptable levels. The final design used was either in series or in parallel to provide detention times from 10 to 20 days. With 10 day detention time, and an addition of 1200 lbs/day of lime, the content of nickel was reduced from 40 to 50 mg/l to less than 1 mg/l, with copper and iron being low in concentration before treatment. At present, research is continuing in the field of underflow disposal. Attempts are being made to overcome the handling problems that prevent this high grade material from yielding a direct profit return. (Lowry-Texas)

DEEP BED FILTRATION OF STEEL MILL EFFLUENTS,
Dravo Corp., Pittsburgh, Pa.
E. S. Savage.
Proceedings, Ontario Industrial Waste Conference, 17th, Niagara Falls, Ontario, p 133-156, June 7-10, 1970. 9 fig.

Descriptors: *Separation techniques, *Filtration, Industrial wastes, Oil, Iron, Hydrogen ion concentration, Automatic control, Baffles, Pressure, Headloss, Water reuse, Particle shape, Particle size, *Waste water treatment, *Steel.
Identifiers: *Deep bed filtration, Millscale, Solids loading, Filter media, Backwashing, Bed expansion.

Deep bed filtration utilizes the entire bed of the filter for solids separation, with solids removal taking place at the voids of the media and not at the media surface. The actual removal mechanisms are not clearly understood, but they seem to be a combination of surface forces, gravity, interception, hydrodynamics, and several others. Since removal occurs within the bed, backwashing arrangements are of great importance in determining the final water quality. Dravo Corporation has successfully utilized deep bed filtration in the final treatment of mill scale and oily waters from steel mill hot rolling systems. Specific loading of 5 to 10 lbs of solids per square foot of filter area are commonly used in mill scale filtration and loading from 1 to 5 lbs solids/ft sq. are common for sewage effluent polishing and process water filtration. Design has commonly proceeded by the rule of thumb method with consequent expensive over-design. Increased understanding of the mechanisms involved, along with pilot scale data allow more optimization of fullscale systems at considerable savings to the industry and with no sacrifice of effluent quality. A case history is presented to substantiate the optimization techniques. (Lowry-Texas)

BIOLOGICAL SURVEY OF THE EFFECTS OF URANIUM MILLING WASTES ON THE WATER QUALITY OF THE SERPENT RIVER BASIN,
Ontario Water Resources Commission, Toronto.
N. Conroy.
Proceedings, Ontario Industrial Waste Conference, 17th, Niagara Falls, Ontario, p 157-178, June 7-10, 1970. 8 fig, 8 tab, 8 ref.

Descriptors: *Acid mine water, *Industrial wastes, Fish, Zooplankton, Chemical precipitation, Neutralization, Ion exchange, *Sampling, *Monitoring, Analytical techniques, Hardness (Water), Alkalinity, Acidity, Hydrogen ion concentration, Lime, Water quality control, Water pollution sources.
Identifiers: *Organic carbon, Dissolved solids, Canada.

Effluents from uranium mines containing acidic compounds have lowered the pH and alkalinity of several lakes in Canada. This lower pH has caused a decrease in the inorganic carbon content of the lake waters, and a corresponding decrease in the planktonic life of the lakes. This decrease in plankton has caused a decrease in game fish which has retarded recreational use of the waters. The preceding conclusions were arrived at by the Ontario Water Resources Commission after three years of observing, sampling, and analyzing the biota of Lakes Quirke, Whiskey, Pecors, Elliot, Dunlop, and Teasdale. No statements were released regarding radioactivity levels until their contribution was thoroughly assessed. The following recommendations emanated from the preceding study: (1) tailings effluents should have pH between 6.8 and 8.0 at point of entrance to receiving waters: (2) automatic monitoring devices for measurement of pH and both dissolved and suspended solids should be required to insure compliance with OWRC standards; (3) the mining industry should investigate methods of restoring the affected lakes to their original pH condition; and (4) the following standards for discharge of mine wastes to poorly buffered waters should be observed, a pH of 6.8 to 8.0, less than 20 ppm sulfates, 1 ppm nitrates, 25 ppm total hardness and 75 ppm total dissolved solids. (Lowry-Texas)

Expansion of the Chrysler Canada Ltd., Wind
Ontario plant necessitated the development
waste water treatment facility. The preliminary
dies on the problem were conducted by a con
ing engineering firm. The plant was designed
built at a total cost of $3,140,000, and close su
vision of detail was provided by Chrysler Can
Ltd in an effort to keep costs down without sacr
ing plant efficiency or capacity. A three s
system was developed to treat effluents contai
welding coolants, acid washwater, phosphate
caustic dip, anti-freeze, gasoline, emulsi
cleaners, paints, free and soluble oils, and h
suspended solids. Stage one consists of 4 h
clarifier tanks utilizing sulfuric acid to break
the oil. The resultant solids are then settled,
tered, and trucked to a municipal landfill. S
two involves removal of suspended solids by ch
cal reaction and air flotation. The floated flo
removed by skimming, concentrated, and
cinerated. Stage three is a solids contact clar
employing alum and coagulant aid to form a slu
and lime or caustic soda to control pH. P
capacity is rated at 2,200,000 gallons on a 16 h
day which can be increased to 3,000,000 gallon
running 24 hours/day. All sludge waste mate
with the exception of grit and heavy solids ar
cinerated. Chemical cost averages 15 cents to
cents/1000 gallons. Sampling on influent and
fluent is automatic, and all samples are analy

RCA Ltd. plant at Midland, Ontario is situated
highly scenic recreational area where pollution
rol of both air and water is essential. The plant
luces only color television picture tubes. Ef-
nts from the plant contain mostly acid and al-
wash and rinse waters. The sewers are broken
n into categories: (1) sanitary sewers con-
ed to the town of Midland sewerage system;
clear water drains for roof drains and untreated
ing waters; (3) caustic drains; and (4) saran-
l steel pipe acid drains. The treatment system
ists of holding tanks, chrome reduction tanks,
ralization tanks, three diatomaceous earth
sure filters, and storage lagoons. The problems
lved with the start up, and the continued
ation of the plant are discussed along with the
edial action taken. Problems ranged from those
ciated with overflow caused by undersized
to those stemming from laundry shrinking of
on filter bags. 50 million U. S. Gallons were
ted in 1969 at a total cost including depreciа-
and overhead of about $1.40 per thousand gal-
. Operational improvements and increased
n plant load are expected to reduce the cost to
ewhere around $1.00/1000 gallons in the near
re. (Lowry-Texas)

ew York law calling for 85% BOD and SS
oval from all effluents brought about a joint
e water treatment study. A pilot plant was con-
cted to determine process design parameters
he treatment of combined domestic and paper
wastes in the city of Plattsburgh. The study was
o steps, the first was a feasibility and economic
y and the second was the pilot plant. Prelimina-
udy and site limitations determined the use of
activated sludge process. Discharge from mill
2 (press effluent) which is only 1% of the total
but contains 50% of the organic load
ented a special problem. Design was made so
plant will operate both with or without the press
ent. Conventional activated sludge was used
he contact stabilization modification was eval-
d because of possible savings on the volume of
aeration tank. Results from the conventional
ess indicated that an excess of 90% BOD
oval can be achieved with loading on the aera-
tion tank below .7 lb BOD/No. MLSS. Results from the modified process indicated that 92% BOD removal from all sources could be obtained at 3 hour contact time and 3 hours stabilization time which indicates no significant economic advantage over the conventional process. A thorough discussion of the two processes including tables, graphs, and schematic diagrams is presented. (Rayyan-Texas)

ACTIVATED SLUDGE SYSTEM VARIATIONS, SPECIFIC APPLICATIONS,
Associated Engineering Services Ltd., Vancouver (British Columbia).
J. M. Stewart.
Proceedings, Ontario Industrial Waste Conference, 15th, p 93-115, June 9-12, 1968. 16 fig, 14 ref.

Descriptors: *Kinetics, *Biological properties *Physical properties, Mathematics, Synthesis, Respiration, *Activated sludge, Wastes, Aeration, Biochemical oxygen demand, Oil, Stabilization, *Sludge treatment, Waste water treatment.
Identifiers: Suspended solids (SS).

To understand how the characteristics and desired degree of treatment can determine the system design requirements, an understanding of the system reaction kinetics is necessary. The physical and biological reactions are discussed with mathematical and stoichiometric equations which cover energy production, protoplasm synthesis and endogeneous respiration. Sludge produced by extended aeration is considerably less than that produced in short term or conventional systems. Mathematical relations describing the reaction kinetics in a soluble and a soluble plus particulate wastes receiving system are presented. After reviewing the conventional activated sludge system, specific application of the activated sludge to suit various types of wastes are presented. The step aeration has the advantage of carrying higher weights of organisms in the system than a conventional system, while still maintaining a lower SS load on the clarifier. Contact stabilization, although it permits the use of the same loading factor of the conventional system, allows up to twice the volumetric loading. It is ideally suited to treatment of waste water in which a large portion of the BOD is present in suspended or colloidal form. The water cooling tower is suitable for treating refinery or petrochemical waste water. Those three systems and five more: Hatfield-Kraus, activated aeration, short term aeration, extended aeration, and aerated lagoons are discussed with their flow diagrams. (Rayyan-Texas)
W71-08018

NEW APPROACHES TO WASTE WATER TREATMENT,
Cincinnati Water Research Lab., Ohio.
Charles L. Swanson.
Proceedings, Ontario Industrial Waste Conference, 15th, p 117-145, June 9-12, 1968. 9 fig, 4 tab, 10 ref.

Descriptors: *Waste water treatment, *Biochemical oxygen demand, Effluent, Pollutants, Biological treatment, Phosphate, Nitrogen, Screens, Sedimentation, *Filtration, Osmosis.
Identifiers: *Suspended solids (SS).

Conventional waste treatment processes are highly effective in removing BOD and SS but not to the extent to make the effluent suitable for reuse application. A table summarizing the waste water pollutants and applicable treatment processes is presented. A discussion on the stage of development of various processes and alternative treatment techniques available or being developed is included. Those processes include: (1) conventional biological treatment, (2) SS and particulate BOD removal, (3) phosphate removal, (4) nitrogen removal, (5) refractory organic removal, and (6) dissolved inorganic removal. These processes are discussed in detail including estimated costs. For example, SS and particulate BOD removal could be achieved by screening at a cost of $0.015/1000 gallons or by filtration at a cost of $0.025/1000 gallons. Removal of dissolved inorganics by electrodialysis is estimated at $0.141/1000 gallons while by ion exchange it is $0.25/1000 gallons. All these estimated costs are summarized in one table. Generally speaking the cost of complete treatment beyond conventional processes for removal of nutrients, organics, and inorganics is estimated at $0.26-0.30/1000 gallons as compared to an average of $0.11/1000 gallons for secondary treatment. However, the fact that water produced from complete treatment methods is potable, and therefore salable, should help to ease the financial burden. (Rayyan-Texas)
W71-08019

PHOSPHATE REMOVAL BY ACID HYDROLYSIS AND CHEMICAL PRECIPITATION,
Ryckman, Edgerly, Tomlinson and Associates, Inc., St. Louis, Mo.
Cecil Lue-Hing, H. D. Tomlinson, and D. W. Ryckman.
Proceedings, Ontario Industrial Waste Conference, 15th, p 203-215, June 9-12, 1968. 7 fig, 12 ref.

Descriptors: *Phosphates, Lime, Acid, Catalysts, Solvent, Colloids, Cations, Enzymes, Hydrogen ion concentration, Temperature, Oxidation, *Waste water treatment, *Organophosphorus compounds, *Chemical precipitation, *Chemical degradation.

Most of the present phosphate removal methods are limited to inorganic phosphates with 100 mg/l concentration utilizing lime within a pH range of pH 8-pH 11 or adsorption and precipitation. This method 'Acid catalyzed Hydrolytic Degradation and Chemical Precipitation' is effective for both industrial and domestic wastes rich in organic phosphates. The factors governing the rate hydrolysis of organophosphates are: (1) pH, (2) temperature, (3) type and concentration of catalysts, (4) structure of compound, (5) type of solvent, (6) collodial gels, (7) complexing cations, and (8) enzymes. The steps used in this process are: after adjusting the waste water to a predetermined pH at ambient temperature and reacting with hydrated lime an insoluble precipitate of calcium phosphate will form which is then flocculated and removed as sludge in the primary sedimentation unit. The phosphate free effluent is released to the other units for further treatment as required. The projected cost of acid processing appears more favorable especially in terms of lime requirements, since it requires less than 25% of the lime used in other processes per unit weight of PO4 removed. Alkaline removal of phosphate as well as all chemical phosphate removal processes in use produce calcium phosphate precipitate in subsequent biological oxidation systems. (Rayyan-Texas)

KINETIC STUDIES OF THE OXIDATIVE DEGRADATION OF DETERGENT AND RELATED SPECIES IN AQUEOUS SOLUTION. I. MICROBIOLOGICAL STUDIES,
Maryland Univ., Baltimore. Dept. of Microbiology.
Marilyn J. Ripin, Kerry F. Noon, and Thomas M. Cook.
Available from the National Technical Information Service as PB-199 365, $3.00 in paper copy, $0.95 in microfiche. University of Maryland Water Resources Research Center, Completion Report, Sept 1970. 69 p 14 fig, 13 tab, 32 ref.

Descriptors: *Detergents, *Biodegradation, *Bacteria, *Cultures, Linear alkylate sulfonates, Oxidation, Microbiology, Kinetics, Model studies, Enzymes.
Identifiers: *Pseudomonas testosteroni, Alkylarylsulfonates, Arylsulfonates, Catechol, Benzene sulfonate, p-toluene sulfonate.

A model simulating bacterial degradation of LAS detergents was devised by employing simpler compounds, benzene sulfonate and p-toluene sulfonate,

as the sole sources of carbon and sulfur. This substitution permitted observation of alkylarylsulfonate oxidation by a single species of bacteria, identified as Pseudomonas testosteroni. The recorded features of the biodegradation process included effect of substrates and buffers, growth kinetics, cells' respiratory activity, and the influence of inhibitors. Results suggested that catechol or corresponding alkyl derivatives form intermediate products, and that the reaction involves participation of at least one enzyme, catechol-2,3-dioxygenase. Oxidation of catechol via a meta cleavage enzyme has been demonstrated with whole cells, as well as cell-free extracts. Biodegradation of linear alkylate sulfonate detergents was achieved only with mixed bacterial cultures. (Wilde-Wisconsin)

RECLAMATION OF WASTE WATER FOR WELL INJECTION,
Los Angeles County Flood Control District, Calif.; and California Inst. of Tech., Pasadena. W. M. Keck Lab. of Environmental Health Engineering.
John K. Mitchell, and William R. Samples.
Los Angeles County Flood Control District, California, Feb 1967. 250 p, 32 fig, 57 tab, 14 ref. Partially supported by a research grant by the US Public Health Service.

Descriptors: *Water reuse, *Injection, *Tertiary treatment, *Filters, *Waste water treatment, *Recharge wells, Injection wells, California, Groundwater, Saline water intrusion, Water purification, Sewage treatment, Water supply, Reclaimed water, On-site investigations.
Identifiers: *Los Angeles, Hyperion plant.

The Los Angeles Flood Control District reports its investigation of high-rate treatment facilities to polish standard-rate activated sludge effluent to make it suitable for use as a water supply for recharge through injection wells. Previous testing by the District using slow sand filtration for Hyperion effluent indicated that a satisfactory water could be provided. Due to the unavailable large land area required by this system, the present test was undertaken to demonstrate the potential of high rate filtration. The investigation conducted at the City of Los Angeles Hyperion Treatment Plant had three basic phases. First was tertiary treatment to polish the standard rate activated sludge effluent. The facilities used for this consisted of parallel operation of a rapid sand filter, pressure sand filter, and a diatomaceous earth filter. Second, the polished water from one of the filters was stored in a reservoir and then recharged into a test site injection well. Third, observation wells were used to monitor the water quality as it moved through the underground aquifer. Either rapid sand filtration with pretreatment or diatomaceous earth filtration can be used to produce water from Hyperion secondary effluent which is acceptable for injection. The estimated cost is $24 per acre-foot. Further testing of water reclamation and injection, on a larger scale, is recommended. It is suggested that the District cooperate with other agencies to make reclaimed water available for operation of the fresh water barriers which are maintained to prevent sea water intrusion. Illinois State Water Survey, Urbana.
Thomas A. Butts, and Ralph L. Evans.
Illinois Department of Registration and Education, Springfield, Circular 99, 1970. 37 p, 16 fig, 12 tab, 5 ref.

Descriptors: *Construction costs, *Treatment facilities, *Sewage treatment, *Cost comparisons, *Cost analysis, Municipal wastes, Waste water treatment, Least squares method, Regression analysis, Estimated costs, Illinois, Cities.
Identifiers: *Sewage treatment plant costs.

Construction costs are summarized for 291 municipal sewage treatment plants built in Illinois between 1957 and 1968. Most of the plants were built under the Federal Construction Grants Program (Public Law 660). Least squares regression analysis was used to relate design population equivalents to either unit costs in terms of dollars per design equivalent or total costs in terms of dollars. The data were categorized into eight classifications for new plants and two for plant additions. Also, regression equations were developed for estimating lagoon land costs, plant operating costs, and FWPCA construction cost indexes. Use of information presented in this circular should provide reasonable estimates of the initial investments involved in constructing and equipping sewage treatment plants in the State. Sample cost estimates are given for each type of plant analyzed. These estimates are not alternatives to detailed engineering cost analyses; rather, they are intended to permit reasonable estimates with a minimum of effort for comparative purposes. Cost figures and design criteria were supplied by consulting engineers, the Illinois Sanitary Water Board, and the Great Lakes Regional Office of the Federal Water Pollution Control Administration. Approximately 325 projects were reviewed, and the data for 291 were considered adequate for statistical analysis. (Poertner)

Identifiers: *Anaerobic lagoons, *Nitrogen balance, Ammonia desorption, Nitrogen transformations, Swine.

The loss of ammonia from an anaerobic manure lagoon has been monitored by measurement of ammonia concentrations in air surrounding the lagoon and by a nitrogen balance for the same lagoon from Nov. 1969 - Oct. 1970. Theoretical considerations of desorption and data from the lagoon indicate that the nitrogen loss to the air can be predicted. An anaerobic lagoon may well be a nitrogen sink if no liquid must be removed from it. The rate of ammonia desorption from a lagoon surface is accelerated by increasing alkaline pH, higher temperatures, and increasing wind velocities. (Christenbury-Iowa State)

nant, Stream quality, Waste management, Manu
collection, Manure transport.

To prevent water and air pollution while maintai
ing environmental quality is a complex problem
becomes more complicated by trying to des
waste management systems which contribu
materially to our effectiveness as pork produc
with pollution control as a side benefit. A sw
manure management system might include a c
lection device, a manure transport system, so
means of manure storage and/or treatment, a
finally, a manure or effluent disposal system
some cases more than one of these compone
may be included in a single component. Giving
tial consideration to the disposal scheme will h
determine decisions to be made concerning
other aspects of the system. There is much rema
ing to be learned relative to the control and m
surement of odors. Various odor levels can

ieved by the judicious selection of manure han-
g techniques. (White-Iowa State)

MANURE LAGOONS.....DESIGN CRITERIA AND MANAGEMENT,
Maryland Univ., College Park. Dept. of Agricultural Engineering.
Harry J. Eby.
ASAE Paper No 61-935. Agricultural Engineering Journal, Vol 43, p 698-701, 714-715, Dec 1962. 6 fig, 1 tab, 19 ref.

Descriptors: *Farm lagoons, *Design criteria, Water temperature, Sewage treatment, Aerobic bacteria, Aquatic plants, Anaerobic bacteria, Algae, Biochemical oxygen demand, Oxidation lagoons, Sludge, Photosynthetic oxygen, Farm wastes, Waste water treatment.
Identifiers: *Site selection, Loading.

Criteria to be considered when designing a lagoon for treatment of wastes produced by animals in confinement is discussed. It mentions situations where lagoons would not be feasible. Seven criteria for site selection are given. The physical, chemical and biological factors discussed include temperature, light, specific gravity, mixing, nutritional effects, pH effects, toxic effects, and interrelationship of biological species. Also mentioned is the algal-bacterial relationship. Design factors for size and volume are given. The article concludes with management problems encountered such as floating debris, overloading, intermittent loading, aquatic weeds and sludge build-up. (Parker-Iowa State)

NITRATE REMOVAL FROM AGRICULTURAL WASTE WATER,
Federal Water Pollution Control Administration, Fresno, Calif.; and California Dept. of Water Resources, Fresno.
Percy P. St. Amant, and Louis A. Beck.
In: Water Quality Management Problems in Arid Regions, Water Pollution Control Research Series, 13030 DYY, 6/69, Oct 1970, USDI, Federal Water Quality Administration, p 1-8. 1 tab, 1 fig.

Descriptors: *Return flow, *Nitrates, Water pollution, Desalination, Algae, Denitrification, California, Filters, Particle size, Anaerobic conditions, Waste water treatment.
Identifiers: *Nitrate removal, Algae stripping, Pond denitrification, Filter denitrification, Methanol, Bacterial denitrification, San Joaquin Valley.

The problem of disposing of irrigation waste water from the San Joaquin Valley of California is a very large one. The most serious potential pollutant is nitrogen in the nitrate form. A waste water treatment center at Firebaugh, California has organized and is carrying out research in the areas of desalination, algae stripping, and bacterial denitrification. Algae stripping simply involves growing a crop of algae to remove nitrogen from the water, and then harvesting the algae. Various markets have been proposed for the use of algae. Two methods of bacterial denitrification being explored are pond denitrification, and filter denitrification. The three denitrification methods are compared as to land requirements and project costs. Each is nearly the same in cost - around $10 per acre foot, however the algae stripping method requires much more land. (See also W71-06111) (White-Iowa State)

WATER QUALITY REQUIREMENTS AND REUSE OF WASTE WATER EFFLUENTS,
Federal Water Pollution Control Administration, Washington, D.C.
Stanley J. Dea.
In: Water Quality Management Problems in Arid Regions, Water Pollution Control Research Series, 13030 DYY, 6/69, Oct 1970, USDI, Federal Water Quality Administration, p 37-44. 1 tab.

Descriptors: *Water quality, *Waste water treatment, *Water reuse, Effluent, Waste water, Water Quality Act, Beneficial use, Water supply, Biological treatment, Sewage effluents, Filters, Activated sludge, Tertiary treatment.
Identifiers: *Nutrient removal.

From the overall view of potential water supply shortages in the United States, advanced waste treatment has the greatest promise at locations where the municipal waste water is presently discharged into the ocean or other sinks, and is lost for reuse. An advanced waste treatment facility for turning waste discharges into potable water is described for New York City. The most urgent needs in sewage treatment technology include modifications of 'conventional' processes and advanced or tertiary treatment. Advanced treatment for the removal of nutrients, organics, and inorganics can be accomplished for about 26-30 cents/1000 gallons compared to 11 cents/1000 gallons for secondary treatment. However, the reclaimed waste water from advanced treatment has economic utility and value for reuse. (See also W71-06111) (White-Iowa State)

DISTILLATION OF WASTE WATERS: A WATER RESOURCE FOR ARID REGIONS,
Federal Water Pollution Control Administration, Washington, D.C. Office of Research and Development.
Allen Cywin, George Rey, Stanley Dea, and Harold Bernard.
In: Water Quality Management Problems in Arid Regions, Water Pollution Control Research Series, 13030 DYY, 6/69, Oct 1970, USDI, Federal Water Quality Administration, p 85-94. 14 ref, 2 fig, 1 tab.

Descriptors: *Distillation, *Waste water treatment, Effluent, Potable water, Water reuse, Water quality, Brackish water, Sewage treatment, Costs, Waste dilution, Demineralization, Water resources.
Identifiers: *Blowdown ratio, Salt removal, Mineral content, Total dissolved solids.

The authors propose distillation of municipal waste water for the production of low mineral content water for industrial purposes, particularly for those industries which require such water in large quantities. Distillation has previously been limited in arid regions to applications using saline waters as a feedwater supply. The use of waste water may very possibly result in less costly distilled water. A part of the waste water renovation costs can be attributed to pollution control. Dilution of tertiary-treated effluents with a lower mineral content municipal water can also produce a product water of acceptable mineral content. The lower concentrations of sulfate and total dissolved solids in waste water effluents is also advantageous. Total treatment costs for the processes involved are given. STORM SEWER SYSTEMS,
American Public Works Association, Chicago, Ill. Research Foundation.
Herbert G. Poertner.
In: Public Facility Needs, Washington, DC, 1966, p 152-174.

Descriptors: *Sewers, *Runoff, *Waste water, *Investment, *Economic analysis, *Drainage, Canals, Precipitation floods, Pollution, Capital, Costs, Benefits, Financing.
Identifiers: User charges, Ownership, Urban drainage.

A description is presented of the nature and composition of storm sewer systems, their functions, and the fundamental principles involved. The services rendered by such systems, particularly avoidance of economic loss from flooding and inadequate runoff, is cited, along with dangers and damages that can exist. Both quantitative and qualitative standards of performance and design are discussed. A brief history of storm sewers is incorporated into a discussion of existing capital plant of the sewers and capital investment in urban drainage improvements is presented by both regional and state breakdowns, indicating both sewer system age and ownerships. Costs, charges, and benefits of the sewer system present the economic basis for the systems, and trends of capital outlay are presented according to expenditures and sources of financing. Estimated capital requirements present a projection for needs and prospective capital outlays in the storm sewer systems and indicate the major sources to be tapped for such financing. SANITARY SEWER COLLECTION SYSTEMS,
Department of Housing and Urban Development, Washington, D.C.
Peter Rowan.
In: Public Facility Needs, Washington, DC, 1966, p 137-151.

Descriptors: *Economic evaluation, *Waste disposal, *Sewers, Capital financing, Costs, Economics of scale, Drainage, Streams, Rivers, Pollution, Groundwater.
Identifiers: *Economic development, User charges, Public service, Ownership patterns, Public health.

A comprehensive study is presented of sanitary sewer collection systems as the means of removing wastes. A brief history of the development of such systems is presented, which incorporates a discussion of pollution in addition to presenting various means of waste removal. The physical characteristics and the standards of performance of the sewer systems are precisely described, and the existing capital plant for such facilities is discussed. Particular attention is given to growth, distribution, and ownership patterns. Construction, operation and maintenance costs are juxtaposed with user charges, and trends in capital outlay are subdivided into annual outlays and sources of financing. Needs and prospective capital outlays for the future are presented, and estimated capital requirements are suggested, along with potential means of financing. The role of federal assistance in the future economic development of the sewer collection systems is also dealt with in some detail. (See also W71-08281) (Murphy-Rutgers)

THERMAL WASTE TREATMENT AND CONTROL,
Federal Water Quality Administration, Corvallis, Oreg. Pacific Northwest Water Lab.
Frank H. Rainwater.
In: Electric Power and Thermal Discharges; Thermal Considerations in the Production of Electric Power. Gordon and Breach, New York, p 189-212, 1971. 3 tab.

Descriptors: *Thermal powerplants, *Cooling, *Cooling towers, Evaporation, Brackish water, Meteorology, Environmental effects, Thermal pollution, Economic feasibility, Waste water treatment.
Identifiers: *Thermal waste treatment, Colling ponds, Cooling systems, Dry cooling towers, Spray canals.

With today's technology the electric power industry can meet State-Federal water temperature standards. Four basic supplementary heat rejection units that are economically attractive at the present time, for large powerplants are described: natural draft towers, mechanical draft towers, open ponds and spray canals. Three alternative cooling systems are discussed: (1) open-cycle system, that may involve either once-through systems or open-cycle waste heat treatment systems incorporating one of the afore mentioned treatment units; (2) recycling systems with waste heat treatment facilities; and (3) combination systems for seasonal operation. It is predicted that spray-type condensers and dry towers of the Heller system will take their place with evaporative cooling systems as a practical and competitive alternative in the near future. W71-08307

CONSIDERATIONS IN TRANSLATING ENVIRONMENTAL CONCERN INTO POWER PLANT DESIGN AND OPERATION,
Duke Power Co., Engineering Department.
William S. Lee.
In: Electric Power and Thermal Discharges; Thermal Considerations in the Production of Electric Power. Gordon and Breach, New York, p 229-248, 1971. 1 fig.

Descriptors: *Thermal pollution, *Thermal powerplants, *Cooling water, *Design criteria, *Environmental effects, Heat, Mixing, Cooling towers, Waste water treatment.
Identifiers: *Heat dissipation, Dry cooling towers, Spray ponds.

To better translate our environmental concern into power plant design and operation, we must develop techniques for reliable ecological forecasting with which we can predict in advance the relative effects of alternative cooling methods. The types of cooling systems classified according to heat dissipation mechanisms are (a1) remote and gradual dissipation by mixing, (2) rapid dissipation locally using open water bodies, (3) rapid dissipation on site with cooling towers and spray ponds, and (4) seasonal shortage of heat in water bodies for later dissipation in cool weather. A drive toward improved cycle efficiencies, including breeders, to reduce heat rejection must be pressed harder. Monstrous in size, costs and in water losses, cooling towers should be critically considered from the viewpoint of alternative, innovative designs. Dry cooling towers should be considered as an alternative. (See also W71-08298) (Oleszkiewicz-Vanderbilt)
W71-08309

POWER PLANT COOLING IN PERSPECTIVE,
Commonwealth Associates, Inc., Jackson, Mich. Architectural and Engineering Systems.
A. C. Kelsall.
In: Electric Power and Thermal Discharges; Thermal Considerations in the Production of Electric Power. Gordon and Breach, New York, p 249-268, 1971. 9 fig.

Descriptors: *Thermal pollution, *Thermal powerplants, *Cooling, *Cooling towers, *Ponds, *Pumped storage, *Peak power, Evaporation, Convection, Radiation, Heated waters, Thermodynamics, Waste water treatment.
Identifiers: Selective withdrawal, Spray ponds.

Following a general presentation of the second law of thermodynamics, the author discusses three means of heat dissipation that can be applied through the cooling facilities: evaporation, convection and radiation. Advantages of cooling ponds are discussed; the need for supplementary evaporative devices, such as spray ponds or cooling towers, is stressed. Assuming that some precooling of power plant water is required, an alternate to riverside cooling towers can be developed where there is room for an off-channel holding pond. A conventional intake structure is used to withdraw cool water from the river. The warm water discharg from the condensers is then pumped up to a h ing reservoir on a 24-hour per day basis, to released, after cooling off, during peak perio The system constitutes a minature pumped stor installation. Water Treatment and Quality Alteration

LATION OF POLIOVIRUS FROM DRINKWATER,
igan State Univ., East Lansing. Dept. of obiology.
er N. Mack, and Donald B. Coohon.
igan Agricultural Experiment Station Journal le No 5276, nd (1970). 7 p, 1 tab, 3 ref. RR Project A-026-MICH (1).

Descriptors: *Water treatment, *Public health, *Viruses, Diseases, Water pollution control, Centrifugation, Isolation, Separation techniques, Chlorination, Disinfection, Coliforms, Bacteria, Waste water treatment.
Identifiers: *Poliovirus, Hepatitis, Gastroenteritis.

Evidence has accumulated to suggest that viruses can be transmitted in drinking water, but no concrete isolations had been made. Multiple cases of illness in the patrons of a southeastern Michigan restaurant, having a private well, initiated a complete epidemiological investigation of the well water. Coliform organisms were found in 2 of 5 samples of the water over a 12 month period, indicating the presence of some fecal contamination. Neither Shigella nor Salmonella organisms were isolated from the water, so further isolation techniques were used specifically to detect whether or not there were viruses present in the water. 5 gallons of well water were obtained from the well, with approximately half being treated with 60 ppm of polyethylene flocculant. Subsequent concentration and centrifugation techniques were successful and an agent was recovered which produced cytopathic effect on Green African monkey kidney cultures. A second initial recovery was also successful, and the agent was subsequently identified by standard laboratory procedures as type II poliovirus. This is believed to be the first isolation of an enterovirus from drinking water in the United States. (Lowry-Texas)

QUALITY VERSUS RESIDUAL CHLORINE,
Public Health Service, Cincinnati, Ohio. Control Technology Branch.
W. Ralph Buelow.
Journal American Water Works Association, Vol 63, No 1, Jan 1971. 10 fig, 3 tab, 9 ref.

Descriptors: *Chlorine, *Coliform, *Water distribution systems, Turbidity, Clarification, Groundwaters, Surface waters, Springs, *Water treatment.

This paper deals with how much, what level of, and the proper surveillance of chlorine residual. A review of some literature which shows the influence of chlorine residual on bacteriological quality in distribution systems as well as the sampling practice in Europe is presented. Chlorine residual in 1966-1967 in Cincinnati, Ohio was maintained at .85 plus or minus .2 mg/l. But in 1969-1970 this was increased to 2 mg/l with 80% as free chlorine. Tabulated results for this period show no appreciable variation in the bacteriological quality of the water and it shows that a change from combined to free chlorine residual and increase in residual concentration reduced the monthly average coliform counts. Study of the bacteriological quality of the distributed water by the use of various systems as related to chlorine practice is presented with supporting figures and tables. It is concluded from that study that surface, spring and raw well water sources need to be chlorinated if coliform was detected in the distribution system and not detected in the raw water. A presentation of this sample procedure and findings for the Cincinnati water system with illustrative drawings and tables is included. The data collected from that system support the suggestion that the bacteriological samples should be collected from known problem areas in reservoirs, dead ends and the periphery of the system. EFFECT OF SEASONAL EFFLUENT CHLORINATION ON COLIFORMS IN JAMAICA BAY,
R. T. Dewling, I. Seidenberg, and J. Kingery.
J Water Pollution Control Fed, Vol 42, No 7, p 1361, Jul 1970.

Descriptors: Investigations, *Chlorination, Effluents, Water pollution sources, Water quality, Data collections, Coliforms, Analytical techniques, *Overflow, *Discharge measurement, Public Health, Water treatment.
Identifiers: *Jamaica Bay (NY), *Storm overflows, Combined sewers.

This article is a report on a study conducted to demonstrate that chlorination of waste water treatment plant effluents would significantly improve the bacteriological quality of Jamaica Bay. A description of the investigation procedure, the Bay area, and its water uses and pollutants is given; water quality data collection analysis is detailed. The average daily discharge from storm and combined sewer overflows was calculated at about 34 million gallons based on a storm occurring at a frequency of about once every three days.

CONSUMER ASSESSMENT OF WATER QUALITY AND THE COST OF IMPROVEMENTS,
California Univ., Berkeley. School of Public Health.
W. H. Bruvold, and P. C. Ward.
Journal American Water Works Association, Vol 63, p 3-5, Jan 1971. 3 tab, 4 ref.

Descriptors: *Water quality, *Costs, Utilities, Water rates, Surveys, Evaluation, Domestic water.
Identifiers: *Consumer assessment, *Interview schedule, Improvements, Complaints.

This paper illustrates how a consumer survey could be used to document the nature and extent of water quality problems and how information could be obtained from consumers regarding their willingness to pay for improvements in quality. Further, the use of such surveys to deal with four general issues involved in improving water quality was discussed. The interview schedule was presented. The final instrument was divided into two main parts: one dealing with consumer assessment of water quality and the other with the cost of the local water, the possible need for improving water quality, and the cost of such improvements. Tabulated data included structure ratings for water in general and taste, reasonable and highest increase, and water rates. (Wang-Rutgers)

SEWER AND ENVIRONMENTAL ASPECTS OF WATER QUALITY STANDARDS,
Munchito Kuribayashi.
Kogai to Taisaku, Vol 6, No 8, p 631-634, Aug 15, 1970.

Descriptors: *Sewers, *Design, *Treatment facilities, *Waste water treatment, Water quality, *Standards, Drainage, Sewerage.
Identifiers: Japan.

Improvements of existing drainage systems and extensive development of drainage works are required on the present sewer systems in order to comply with new water quality standards. Large-scale sewerage works, planned on a basin area unit system, have more advantages because of the mixture of treated wastes produced. Advanced system engineering dealing with dynamic programming and multi-level-techniques will be employed in this sewer scheme which eventually may decide general water quality.

THE DESIGNATION OF THE AREA AND THE WATER QUALITY STANDARD OF THE RIVER KANO,
Yoji Ogawa.
Kogai to Taosaku, Vol 6, No 7, p 541-549, Jul 15, 1970.

Descriptors: *Water pollution sources, *Water quality control, *Standards, *Water pollution control, Urbanization.
Identifiers: *Japan, *Kano River Basin.

The Kano River Basin supports fresh water fish and the water is used for irrigation purposes. Industrial development and urban growth in the vicinity of the river basin have contributed to the water pollution problem. The Economic Planning Agency which investigated the quality of the basin water in the years 1966 and 1967 designated the water area and the water quality standard so as to maintain water quality control. By the year 1975, the pollution degree is estimated to decrease approximately 60% with water pollution control based on the new standard.

ff coefficient, Rainfall intensity, Drainage dis-
Costs.
ifiers: *Des Moines (Iowa), *Storm sewers.

uthor presents a method of storm sewer as-
ent which was applied to a project in Des
es, Iowa. Four benefit factors considered in
tioning property costs can be utilized in storm
assessment if the relative weight of each fac-
determined by the relative benefit to be ac-
. Other factors to be considered reflecting
and therefore benefit are: (1) the area
ed, (2) the runoff coefficient, (3) the rainfall
sity, (4) the distance to the outlet, (5) the unit
cost, and (6) the slope of the sewer. Each of
factors are discussed in relation to a sub-area.
the dollar benefit to each sub-area is deter-
l, the benefit to individual properties within
reas must be ascertained. Also, in arriving at
sewer assessment, the benefit accruing to
c property must be considered. Means for
ating all of these factors are thoroughly
ibed. The Des Moines procedure outlined in
rticle does not necessarily have application to
orm sewer special assessment problems. The
f the method will come through its application
variety of storm sewer assessment problems
with success in the courts.

gation Drainage Div, Am Soc Civil Engrs, Vol
o IR3, p 342-343, Sept 1970.

iptors: *Storm drains, *Flow rates, Computer
ams, Methodology, Drainage systems, Design.

writer, discussing his original paper with the
title, has thus far been unable to comprehend,
e extreme case of a submerged storm system
and assumed incompressible water, how the rate of flow out of the system at the outfall can differ from the rate of inflow at the inlets at any time. A lag time has been introduced into the computer program to allow for utilization of storage available within the system. The writer agrees with the thought that the design flows at individual points may be found from intensities occurring when peak flows reach the points, but he disagrees with the thought that the design for flows between the points can be made for the same hydraulic grade at different times.

$37 BILLION: NEW PRICE TAG FOR CITIES' WATER POLLUTION CONTROL COSTS.
Nation's Cities, Vol 8, No 8, p 8-9, Aug 1970.

Descriptors: *Estimated costs, Cost allocation, Cost analysis, *Cost comparisons, Cost sharing, *Costs, Cost trends, *Cities, City planning, *Sewers, Water resources development, Legislation, Treatment facilities, Storm runoff, Overflow, Separation techniques, *Storm sewers, Water pollution control.

The National League of Cities (NLC) and the United States Conference of Mayors (USCM) estimated between $33 billion and $37 billion will be needed to combat water pollution between 1970 and 1976, as reported by Senator Muskie, in comparison with FWQA reports of $10 billion over the five year span, 1970-1974. The NLC-USCM survey asked for specific cost data categorized in the following manner: (1) needs for primary and secondary treatment facilities; (2) needs for tertiary treatment facilities; and (3) needs for interceptor and storm sewers, including projected costs of separating storm and sanitary sewers, and/or storing storm water overflows. The survey covered 1,008 communities with a combined population of approximately 89.4 million. Based on the projection from this survey, the NLC and USCM estimated the total national needs for state and local water pollution control facilities for the next six years which includes a five percent inflation factor. Discussion on past, present, and future legislative action is included, and a cost chart based on survey results is given.

STORM DRAINAGE FACILITIES, UNION COUNTY, NEW JERSEY.
Union County Planning Board, N.J.

May 1970. 97 p.

Descriptors: *Floods, New Jersey, *Drainage, Storms, Design, Storage, Flow, *Storm drains, Water pollution control.
Identifiers: *Union County (NJ), *Storm sewers.

The report presents an inventory and analysis of the storm drainage facilities of Union County, New Jersey. Points of analysis were generally selected where streams cross major County throughfares. The tributary area to each of these points was determined. Estimates of minimum design flows were prepared. These suggested minimum design flows were then used to determine the adequacy of the existing drainage facility at the point of analysis.

POLLUTION STINK FOULS CITY HALL,
K. W. Bennett.
Iron Age, Vol 206, No 7, p 73-75, Aug 13, 1970.

Descriptors: *Legislation, Water pollution control, Water quality control, Industries, *Cities, *Pollution abatement, Legal aspects.
Identifiers: *Law enforcement.

Although legislation has been passed concerning water pollution control in relation to industries and municipalities, enforcement of these laws has been directed more towards industrial control. However, the number of states taking action against cities which are pollution violators is on the rise. The author views the economic plight which the city faces and gives some examples of pollution abatement programs and treatment facilities under construction in cities across the United States.

AERATOR PERFORMANCE IN NATURAL STREAMS,
Rutgers-The State Univ., New Brunswick, N.J. Water Resources Research Inst.
Shaw L. Yu.
Journal of the Sanitary Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 96, No SA5, p 1099-1114, Oct 1970. 8 fig, 2 tab, 12 ref, 2 append. OWRR Project B-022-NJ (5).

Descriptors: *Aeration, *Mechanical equipment, *Water treatment, Streams, Evaluation, Dissolved oxygen, Rivers, Oxygenation.
Identifiers: Aerator efficiency, Surface aerators, Diffuser aerators.

The oxygen transfer efficiency of a commercially available surface mechanical aerator and diffuser aerator was tested on Passaic River (New Jersey). Both types of aerators were found to be substantially less efficient in the natural stream than in tanks or lagoons. Average transfer rates of the mechanical and the diffuser aerators were 2.1 and 1.2 lb of oxygen per hp-hr, respectively. The efficiency of both aerators increased with a higher rate of river discharge. The estimates of the DO at the aerator corresponded to the average of upstream and downstream DO readings. In designing a river aeration system it is essential to know the aerator's performance in the given stream. Examples illustrate conversions of specific standard transfer rates, commercially specified, to actual conditions. (Wilde-Wisconsin)

INSTITUTIONAL DESIGN FOR WATER QUALITY MANAGEMENT: A CASE STUDY OF THE WISCONSIN RIVER, VOL I, SECTION A - SUMMARY,
Wisconsin Univ., Madison. Water Resources Center.
Elizabeth L. David, Peter N. Davis, Irving K. Fox, Anthony H. J. Dorsey, and Charles H. Faulkner.
Available from the National Technical Information Service as PB-199 268, $3.00 in paper copy, $0.95 in microfiche. Technical Report, 1971. 165 p, 12 fig, 7 tab, 24 ref. OWRR Project C-1228-Wis (8).

Descriptors: *Watershed management, *Water quality, *Wisconsin, *Evaluation, *Optimum development plans, *Cost-benefit analysis, Administration, Appraisals, Administrative agencies, Coordination, Feasibility studies, Financial feasibility, Institutions, Methodology, Regional analysis, Analysis.
Identifiers: *Wisconsin River Basin (Wis).

A case study was made to determine least-cost systems for achieving specific water quality levels of the Wisconsin River Basin (Wisconsin). To initiate least-cost systems, institutional prerequisites were analyzed and alternative institutional structures considered. By application of a predictive water quality model based on dissolved oxygen and analysis of costs influencing DO levels, costs of systems to meet specified objectives are determined indicating that substantial economies can be realized by utilization of a regional management system. Alternative policies and organizational arrangements are assessed. Potential and equitable economics could be realized with substantial changes in policy framework; an effluent-charge system would prove unnecessarily costly and its administration difficult; effective results can be achieved by a combination of regulation and cost sharing of system management by waste producers. Criteria of organizational design are established and applied to three alternative organizational arrangements. An organizational system including a quasi-judicial body (to establish standards), a state water resources agency (to monitor environmental interests), and a regional implementing and operating agency would most effectively meet the desired criteria. COMBINED SEWER OVERFLOW SEMINAR PAPERS.
Federal Water Pollution Control Administration, Washington, D.C. Div. of Applied Science and Technology.

Available from the National Technical Information Service as PB-199 361, $3.00 in paper copy, $0.95 in microfiche. Papers presented at Seminar at Hudson-Delaware Basins Office, Edison, NJ, Nov 4-5, 1969, Water Pollution Control Research Series DAST-37, Mar 1970. 199 p. EPA Program 11020--03/70.

Descriptors: *Waste water treatment, *Storms, Run-off, Disinfection, Coliforms, Flotation, Flocculation, Coagulation, Screens, Hydrographs, Head loss, Pressure, Economic feasibility, Technical feasibility, Cost analysis, Maintenance, Labor.
Identifiers: *Combined sewers, Segregated sewers.

A large number of cities still have combined sanitary and storm water sewers. During storms, the overflow from these sewers passes directly to the receiving waters, since the volume is too great for the treatment plant to handle. The ever-present emphasis on pollution has focused much attention on not only combined sewers, but on untreated storm water from segregated sewers as well. In falling through the atmosphere, and in washing down buildings and streets which are covered with organic pollution, the storm waters become nearly as polluted as sanitary flows, and often times more so. All of the papers presented at the conference are concerned specifically with the abatement of pollution stemming from the use of combined sewers. However, rather than reporting on methods of changing the sewer systems, most research being done calls for treating both flows anyway. Methods discussed range from microstraining to air flotation to tunnels for storage before subsequent sea disposal. Combined sewer wastes can be treated at costs reported here ranging from 4 cents to 29 cents per 1000 gallons. From these reports and investigations it becomes apparent that the technology to clean up stormwater pollution is available, the only thing lacking is its implementation. STORAGE AND TREATMENT OF COMBINED SEWAGE AS AN ALTERNATE TO SEPARATION,
Banister Engineering Co., St. Paul, Minn.
A. W. Banister.
In: Combined Sewer Overflow Seminar Papers, p 19-36, Mar 1970. EPA Program 11020---03/70.

Descriptors: *Runoff, *Storms, Municipal wastes, Hydrographs, Floods, Sewers, Pumps, Storage, Ponds, Sampling, Odors, Maintenance, Waste water treatment.
Identifiers: Segregated sewers, Combined sewers.

A storm water storage pond has been constructed by the city of Chippewa Falls, Wisconsin. Combined sewers serve nearly all of the downtown section, and the city was ordered to separate the sewers to reduce the pollutional load on the Chippewa River. Availability of federal and state aid for development of alternatives to segregated sewers resulted in the design and construction of a holding pond system. A suitable area was located, and a pond of 10.7 acre feet was designed on the basis of data on a ten year storm. The pond was lined with a bituminous mat to facilitate cleaning and allow vehicular traffic within the pond for maintenance and grit removal. Concurrent with pond construction, additional pumping capacity was added to the pumping station, and secondary treatment facilities were added to the treatment plant. A sampling program was also instituted at this time. So far, there have been no flooded basements, no odor problems, and only two pond discharges, one of 67 mg/l BOD5 and the other of 27 mg/l BOD5. No cost estimate is presented for either the total project or the operating costs. However, problems have so far been few and maintenance has been minimal. (See also W71-07978) (Lowry-Texas)

The reduction of pipe friction, with its corresp
ing increase in flow was the subject of a 29 m
research and demonstration project. 6 poly
were tested as to their ability to decrease pipe
tion. Of these, Polyox Coagulant-701 and W
301, both supplied by Union Carbide Co. and
30, supplied by Dow Chemical Co., were the
effective. Concentrations of 150-200 ppm
polymer caused flow increases of as much a
times the original flow. From laboratory testing
project moved on to a 1563 ft. length 30 in
diameter sewer line in Dallas. 6 Piezometers
positioned, and provisions were also made for
perature measurement and sewage sample co
tion. Four runs were made to test Polyox WSR
and Polyox Coagulant-701 with polymer con
trations varying from 35-100 mg/l. These and
laboratory studies have yielded the follo
results: (1) polymers are non-toxic to bac
found in sewage during these tests; (2) poly
have neither toxic nor nutrient effects on algae
polymers are not toxic to fish; (4) a 500 mg/l
centration of polymer has a BOD5 of 1.56
and (5) polymers aid in the dewatering of slu
Addition of polymers to sewer lines in Gar
Texas to relieve surcharging of the lines is

Suspended solids, Ozonation.

Microstraining has been investigated as a po
treatment method for stormwater overflows
combined sewer systems. Suspended
removals ranged from 78% to 98% using
micron screen under relatively high throug
conditions. Lower throughput volumes result
a solids removal range of 62% to 96%, with
the average. Volatile suspended solids rem
were directly correlated with suspended
BOD, on the other hand, actually increased i
17 measurements. Three possible explanatio
these phenomena are: (1) natural predators
bacteria are removed by the screen; (2) large
terial colonies are subdivided into larger nu
by straining; (3) the screening process make
bacterial food supply more available. The la
planation seemed most likely. Also, increase
idation at the point of entry will cause downst
effects to be less persistent. Further resear
needed to determine the effects of using
higher differential head. At this time, no o
tional problems have developed. A cost an
shows barscreening, microstraining and chlo
tion to cost from $10,500 to $12,800 per ac
area served. The cost of construction of sepa
sewers alone was estimated to be between $2
to $23,000 per acre. Since storm water, becau

ended and dissolved solids picked up from
t, houses, and the atmosphere, has come to be
rded as a pollutant in itself, the segregated
rs have little or no value. Therefore, develop-
t and refinement of the microstraining
niques should lead to wide spread applications
oth combined and separated sewer systems.

ng periods of heavy rainfall, sewer systems col-
ng both sanitary wastes and stormwater over-
the treatment plant capacity and cause the
t discharge of an estimated 9.5 million lbs of
, 224 million lbs of suspended solids, 3.5 mil-
lbs of total phosphates, and 1.0 million lbs of
nitrogen to receiving waters in the District of
mbia. These estimates were obtained from ex-
ve sampling studies performed at three monit-
g installations in the District of Columbia dur-
969. The studies were performed to determine
haracteristics of stormwater run-off, both in
gated sewers and combined sewers. Results
ated that significant pollutional loads are
arged from both types of sewers. Four alterna-
methods of abating the pollution from storm-
r run-off include: (1) sewer separation; (2)
ystem storage; (3) in-line treatment, and (4)
ellaneous. However, based on the initial
lings separation was ruled out. The remaining
ods were analyzed according to the overall
irements for the entire area. Final costs esti-
s are not yet available, but these studies have
onstrated the feasibility of the regional
rage plant in this instance. (See also W71-
8) (Lowry-Texas)

DLE LEE SETS THE STANDARD,
r Beaumont.
eyor, Vol 136, No 4075, p 45-46, July 1970.

Descriptors: *Water quality control, *Domestic wastes, *Industrial wastes, Separation techniques, Sewage treatment, Activated sludge, Aeration, Filtration, Screens, Design criteria, Methane, Anaerobic digestion, Temperature, Biochemical oxygen demand, Fish, Toxicity, Water reuse, Tertiary treatment, Cost analysis, Waste water treatment, *Standards.
Identifiers: *River Lee, Suspended solids, Grit, Great Britain, BOD5.

New Town development in the Lee Valley caused great concern that the already overloaded River Lee would deteriorate further and become merely an open sewer. This problem was especially important because the River Lee empties into the Chingford Reservoir, which supplies 19% of the water supply of Metropolitan London. Final effluent standards set in 1955 required that the effluent contain less than 5 mg/l SS in summer, and 10 mg/l SS in winter, less than 5 mg/l BOD in summer and 10 mg/l BOD in winter, and a free ammonia content of less than 10 mg/l under both summer and winter conditions. Construction was accomplished in three stages, the first stage having a capacity for 8 mgd. Stage 2 was of the same size as stage 1, however, the plant capacity had to be redesigned before completion of stage 2. The final capacity of the finished plant was set at 30 mgd to compensate for rapid population growth. The treatment works consisted of screening, maceration, grit removal, and primary sedimentation. Secondary treatment of activated sludge using diffused air was provided, and tertiary treatment was assigned to rapid gravity sand filters. Primary and secondary sludge is digested anaerobically, and the sludge is distributed free as a top dressing or soil conditioner. Total plant cost was estimated at 6 million Pounds Sterling. Water quality rapidly improved after the new plant was put into operation, more than justifying the investment. (Lowry-Texas)

A MANAGEMENT ATTITUDE TOWARDS WATER CONSERVATION,
Shell Canada Ltd., Corunna (Ontario).
T. A. McIver.
Proceedings, Ontario Industrial Waste Conference, 17th, Niagara Falls, Ontario, p 3-10, June 7-10, 1970.

Descriptors: *Oil wastes, *Phenols, Industrial wastes, *Management, Engineering education, *Water pollution control, Sedimentation, Flotation, Saline water, Sewers, *Waste water treatment.
Identifiers: *Segregated sewers, Canada.

The Shell Oil Company at Corunna uses 28 gallons of water for every gallon of crude processed, or 50 million Imperial gallons/day. The water is taken from the St. Clair river, and 95% is used once and returned to the river. The plant was constructed in 1952, and in 1955, the first biological treater for treating phenolic wastes in Canada was installed there. Since that time, in 1969, a larger API separator and trunk sewer line for oily water have been installed. A salt brine pond has also been constructed to prevent contamination of the river. The major reason for the small amount of pollution produced at the Corunna plant has been attributed mainly to good housekeeping within the plant itself. Education of all supervisory personnel on important factors of spillage prevention and control has significantly reduced both the oily discharges and the phenolic discharges from the plant. (Lowry-Texas)

CONSERVATION, RECLAMATION AND REUSE OF SOLIDS AND WATER IN POTATO PROCESSING,
Manitoba Univ., Winnipeg.
R. E. Gransfield, and R. A. Gallop.
Proceedings, Ontario Industrial Waste Conference, 17th, Niagara Falls, Ontario, p 42-52, June 7-10, 1970.

Descriptors: *Industrial wastes, *Potatoes, Research and development, Pilot plants, Adsorption, Activated carbon, Microorganisms, Proteins, Water management (Applied), Sewers, Technical feasibility, Economic feasibility, *Water reuse, Waste water treatment.
Identifiers: *By-product recovery, *Waste stream segregation, Lye peeling, Stem peeling.

Waste water management in the potato industry must be more carefully controlled to stop unnecessary discharges of large quantities of water to receiving waters. Separation of sewers and by-products recovery of starch have recently come to light as possible pollution abatement techniques. At the present time, processing of 750,000 lbs of raw potatoes per day requires in excess of 1 MGD of water, with a similar waste water flow. Current research work being conducted in the area includes the development of the dry caustic peeling process, preparation of activated charcoal from waste potato solids, culturing of mixed microbial populations on solid potato wastes to produce high protein food supplements, and many others. The researchers at Manitoba University have also developed a chemical treatment process for potato wastes which is presently being tested on a pilot plant scale. Much further research work must be carried out before an optimal solution, both from the standpoint of technical and economic feasibility, can be reached. (Lowry-Texas)

APPLICATION OF AUTOMATIC SAMPLING TO TODAY'S WATER QUALITY CONTROL PROGRAMS,
Gurnhamand Associates, Inc. Chicago, Ill.
Fred C. Gurnham, and Martha I. Beach.
Proceedings, Ontario Industrial Waste Conference, 17th, Niagara Falls, Ontario, p 109-118, June 7-10, 1970.

Descriptors: *Sampling, *Automatic control, Analytical techniques, Analysis, *Monitoring, Dissolved oxygen, Temperature, Flowmeters, Pumps, Weirs, *Water pollution control, Hydrogen ion concentration.
Identifiers: *Pump sampler, *Scoop sampler, Vacuum sampler.

The following variables must be considered in the selection of automatic sampling equipment: (1) accessability of sampling site; (2) general character of the wastes; (3) flow patterns; and (4) analyses to be performed. To accommodate the preceding variables, there are 6 main types of samples, namely: (1) individual or 'grab'; (2) simple composite; (3) sequential composite; (4) continuous; (5) hand proportioned composite; and (6) automatic proportioned composite. Sampling equipment ranges in price from a few dollars to several thousand dollars, and in size from the portable to the permanent models. A brief description of the various samplers includes vacuum or compression samplers fixed volume and scoop samplers, cup or bucket elevator samplers, and pump samplers. The important service provided by a sampling schedule must include production of a sample of adequate size, provision for preservation, and provision for containment until analyses can be performed. Growing concern with environmental pollution has caused much interest in monitoring pollutional parameters, but without a representative sample, all analyses performed are merely wasted. Therefore, specification, installation, and operation of automatic sampling devices must be considered a critical part of any waste survey. (Lowry-Texas)

TECHNIQUES OF DEEP WELL DISPOSAL-A SAFE AND EFFICIENT METHOD OF POLLUTION CONTROL,
American Industrial Disposal System Inc., Pittsburgh, Pa.
Robert S. Stewart.
Proceedings, Ontario Industrial Waste Conference, 15th, p 37-43, June 9-12, 1968. 1 fig.

Descriptors: Water pollution control, *Deep wells, Geologic formations, Saline water, Gas, Oil, Cementing, Casing, Costs, *Waste water disposal.

The basic requirements for a deep well disposal system are: a subsurface horizon, preferably of sand stone filled with salt water, and located at a sufficient depth and suitable geological sequence so there might be no contamination of any water sources. The primary disadvantage or danger of the deep well disposal is the pollution of groundwater which could be limited through original program design. The techniques of drilling a deep well disposal system and equipping it in a satisfactory manner are derived from the oil and gas industry but with the primary concern that this well should be free of any possible defects that could allow contamination of potable water or mineral sources. This could be achieved by an elaborate control over the drilling, casing and cementing program. A schematic diagram showing all these factors is given. In general the cost of the deep well disposal is about one third of any other method of neutralization. (Rayyan-Texas)

INCINERATION OF PROCESS INDUSTRY WASTES,
Trecan Ltd., Cooksville (Ontario).
W. K. Lombard.
Proceedings, Ontario Industrial Waste Conference, 15th, p 43-60, June 9-12, 1968.

Descriptors: *Incineration, *Wastes, *Oxygen, Temperature, Turbulence, Liquids, Costs, Fuels, Disposal, *Waste treatment, *Waste disposal, Waste water treatment.

Combustion, or incineration is one of the effective methods of disposal of industrial wastes. Analysis of the wastes involved could determine the possibliity of this method. Incineration equipment should have air for oxygen and temperature, turbulence and time for good combustion. The types of wastes that could be handled by this method are: (1) rich liquids, (2) weak liquids, (3) halogenated liquids, (4) fumes and high heating, volume bulk materials. These wastes along with the suitable incinerator are discussed in detail including cost. An example of the cost range for a rich liquids incinerator of a 500 lb/hr burning capacity is $10-15,000 while the cost of a 2000 lb/hr weak liquids incinerator is $35-40,000 and would require 8 million BTU/hr of auxiliary fuel. Heat recovery from these incinerators is recommended only if the savings or by-products created will pay for the additional initial cost in no more than one year. An example case of a central disposal facility which is being constructed at Moore on the St. Clair river is reviewed. (Rayyan-Texas)

SEWER FLOW MEASUREMENT IN A LARGE INDUSTRIAL PLANT,
Polymer Corp., Sarina (Ontario).
D. D. Livingstone.
Proceedings, Ontario Industrial Waste Conference, 15th, p 146-156, June 9-12, 1968. 8 ref.

Descriptors: Treatment facilities, Survey, *Measurement, *Sewers, *Flow rate, Velocity, Costs, Sedimentation basin, *Current meter.

For accurate design of new pollution control facilities, and more accurate measurement of the actual performance of the treatment facilities, a survey scheme was developed in 1967 to measure all important discharges and identify the sources of these streams. The allowable error was 10%. Description of the plant and the treatment facilities with a plan layout is given. A recommended eight point survey plan is outlined. The measurement equipment used in this survey was the portable type, at a cost less than $500. The Doll flow tube, the current meter, the pilot tube, bucket and stop watch (bucket was used for settling basin) and the salt dilution methods gave the required results within the allowable error and at a low cost. THE ECONOMICS OF ALTERNATIVE METHODS OF WHEY DISPOSAL AT SOUTHERN ONTARIO CHEESE FACTORIES,
Ontario Dept. of Agriculture and Food, Toronto.
R. W. Redelmeier, and D. A. MacDonald.
Proceedings, Ontario Industrial Waste Conference, 15th, p 157-202, June 9-12, 1968. 8 tab, 14 ref.

Descriptors: *Nitrogen, *Hogs, *Waste disposal, Pollution disposal, Drying, Costs, Fertilizer, Foods, Water pollution control.
Identifiers: Whey, Cheese, Lactose, Spray drying, Roller drying.

Whey is the residual by-product in cheese making. It is 93% water, 4.9% lactose, .9% nitrogenous matter, .6% ash, .3% fat, and .2% lactic acid. For every 100 lbs milk used, 90 lbs are whey. Ontario produces one billion pounds of whey annually. Disposal of whey as hog feed and as waste is decreasing. Other advantageous methods of disposing of whey without causing pollution problems are spray or roller drying. An adequate supply of quality whey within reasonable trucking distance and sufficient demand at attractive prices for whey products are the conditions for satisfactory whey drying operations. Cost of whey drying ranges from $30,000 for roller drying with a capacity of 27,000 lbs to $1,055,000 for spray drying with a capacity of one million lbs. A variety of new whey products have been developed in Europe (vinegar and beverages). Research work on whey is under way in Canada, while in the U. S. considerable research has been done on the use of whey as an ingredient in the bakery industry, frozen food and related fields. By 1965, 100 whey processing plants existed in the U. S. However, further research is warranted not only on the production aspects of whey but on their marketing potential including consumer acceptance. (Rayyan-Texas)

ifiers: Oil spills, *Oil recovery system, drick Industries Inc.

mplete open-ocean oil recovery system has developed and tested by Headrick Industries, near Coal Oil Point, California. Included in system are booms, towing harness, recovery and transport vessel, and fabric tank. A description is given of the testing of the system. The oil separation technique involves flow of a controllable and limited surface depth of water into an unagitated gravity separator where the oil is then skimmed off the surface and transferred to the oil storage tank. This recovery system can operate in varying slick and sea state conditions, with a maximum oil transfer capacity of 800 to 1500 gallons per minute. (McEntyre-PAI)

INFORMATION AVAILABLE ON DISPOSAL OF SURPLUS PESTICIDES, EMPTY CONTAINERS AND EMERGENCY SITUATIONS.
Working Group on Pesticides, Washington, D.C.

Available from the National Technical Information Service as PB-197 146, $3.00 in paper copy, $0.95 in microfiche. Working Group Report DR-3, Sept 1970.

Descriptors: *Pesticides, *Insecticides, *Waste disposal, Herbicides, Water pollution treatment, Landfills, Solid wastes, Sewers, Lagoons, Injection wells, Industrial wastes, Incineration.
Identifiers: *Containers, Earth fills, Agricultural wastes, Air pollution control equipment, *Solid waste disposal, Sanitary landfills.

The information available on research in progress and recommendations on disposal methodology, pinpoint problem areas related to the disposal of surplus pesticides, wastes and empty containers in the first chapter. Sources of wastes, definitions for various disposal methods such as deep-well, sanitary landfill, disposal pits, lagoons, surface or ground disposal, etc., estimates of number of empty containers, and a list of companies who manufacture incinerators and flue gas scrubbers are included in its appendixes. Detoxification, handling, reconditioning and reuse of empty 55-gallon pesticide drums including decontamination by chemicals, decontamination by incineration and information needed on decontamination and drum reuse are presented in Chapter II WITH A LISTING OF FIRMS HAVING BURNING EQUIPMENT. Storage and handling pesticides and empty containers form Chapter III. Chapter IV is on detoxification of decontamination of transportation equipment and disposal and handling of pesticides or wastes resulting from accidents. Chapter V includes emergency assistance information and methods and an appendix on the National Agricultural Chemicals Association pesticide safety team network. Written by four authors from different federal agencies who formed a task group.

CENTRAL FRESNO COUNTY WATER AND LIQUID WASTE PROGRAM,
Fresno County Planning Dept., Calif.

Available from the National Technical Information Service as PB-197 507, $3.00 in paper copy, $0.95 in microfiche. Grunwald, Crawford and Associates-Engineering Science, Inc. Summary Supplement Report, Mar 1970. 7 p.

Descriptors: *Regions, California, *Water supply, *Waste disposal, Sewers, Groundwater, Urbanization, Economic aspects, Water reuse, Industrial wastes, Sewage treatment.
Identifiers: *Regional planning.

The primary objective of the Water and Liquid Waste Program for the Central Fresno County Urbanizing Area has been to develop short-, medium-, and long-range programs for providing water supply and sewerage facilities from 1970 to 2015. A major emphasis of the study has been related to the protection of public health and the maintenance of groundwater quality and quantity in future years. The presentation which follows is a summary of the major findings, conclusions, and recommendations of the report with regard to (1) future growth requirements, (2) significant features of recommended water and sewerage systems, (3) the indicated financial requirements, and (4) considerations for implementing the recommended program.

DOCUMENTATION REPORT--FWQA DYNAMIC ESTUARY MODEL,
Environmental Protection Agency, Washington, D.C. Water Quality Office.
Kenneth D. Feigner, and Howard S. Harris.
Available from the National Technical Information Service as PB-197 103, $3.00 in paper copy, $0.95 in microfiche. July 1970. 248 p, 50 fig, 7 tab, 22 ref, 1 append.

Descriptors: *Mathematical models, *Estuaries, *Computer programs, *Hydraulic models, *Water quality, Dynamics, Flow, Dispersion, Biochemical oxygen demand, Dissolved oxygen, Regression analysis, Input-output analysis.
Identifiers: San Francisco Bay, San Diego Bay.

The necessary theory, background, and guidelines for applying the FWQA dynamic estuary model to an arbitrary estuary was presented. The discussion reflected FWQA experience in applying the model to the San Francisco and San Diego Bay estuaries. The model was utilized to simulate a wide variety of hydraulic and water quality conditions in these two systems, and through the course of its development, testing, and use, under-went significant change. The model represented the two-dimensional flow and dispersion characteristics of an estuary and could be applied to any estuary wherein vertical stratification was either absent or limited to relatively small areas within the estuary. The model could accommodate both conservative constituents including the interrelationship between biochemical oxygen demand (BOD) and dissolved oxygen (DO). Two separate, but compatible components were developed: a hydraulic program (DYNHYD) and a quality program (DYNQUA). A third program, a harmonic regression analysis (REGAN) was utilized to reduce input requirements for specifying the tidal conditions imposed on the system. A hydraulic extract program (HYDEX) summarized the hydraulic output while a quality extract program (QUALEX) summarized the output from the quality program. A final program (DATAP) was developed to prepare basic inputs to the hydraulic program. (Kriss-Cornell)

APPLICATION OF USER CHARGES TO WATER QUALITY MANAGEMENT,
Chicago Univ., Ill. Graduate School of Business.
Charles Upton.
Water Resources Research, Vol 7, No 2, p 264-272, Apr 1971. 9 p, 4 tab, 15 ref.

Descriptors: *Optimization, *Taxes, *Water quality control, *Costs, Pollutants, Dissolved oxygen, River basins.
Identifiers: *User charges, Miami River.

The relative effects of optimal taxes and user charges were investigated for the Miami River basin in Ohio, and the user charges appeared preferable to the optimal tax. First, some previous studies and the geography of the Miami River basin were discussed. For the model three functions were estimated: the cost of treatment for each plant, the cost augmentation, and the water quality function. It was shown that the authority will incur a loss if the optimal tax was used and this deficit makes them undesirable. With the alternative of user

charges each firm that discharges pollutants pays a 'share' of the cost of centralized treatment. Two schemes were proposed to determine what share of the costs would be borne by each firm: (1) increased permissible waste load method, and (2) waste load discharge method. The effect of different choices for the water quality standard was examined by computing 11 levels of dissolved oxygen for the Miami River. The minimum cost of meeting each of the standards was calculated and the efficient production locus was thus obtained. If taxes were levied to achieve the minimum cost of water quality standard, the receipts would pay about 85% of the cost. User charges would erase this deficit at an additional total cost of only about 1 percent. (Kriss-Cornell)
W71-08196

CHEBYSHEV OPTIMAL WASTE DISCHARGES,
Yale Univ., New Haven.
Matthew J. Sobel.
Supported by National Science Foundation. Operations Research, Vol 19, No 2, p 308-322, Mar-Apr 1971. 15 p, 11 ref.

Descriptors: *Optimization, *Waste treatment, *Water quality, *Storage capacity, Linear programming, Dynamic programming, Discharge measurement, Water resources.
Identifiers: *Chebyshev criterion.

A model for evaluating alternative schedules for storing wastes and discharging stored wastes into a water resource was provided. The central problems were (1) for a given capacity, what discharge schedule maximizes the minimum water quality during a finite horizon, and (2) for a given minimum water quality during a finite horizon, what is the smallest storage capacity for which there exists a feasible discharge schedule. Problem (1) used a Chebyshev criterion where the problem was to find a point in the domain that minimized the maximum among the functions (or maximized the minimum among the functions). The suitability of a Chebyshev criteria for water quality problems was discussed. Then problems (1) and (2) were given deterministic formulations and the terminology of a holding-pond problem was used for ease of exposition. The nonlinear-programming problems based on (1) and (2) shared a base-level property and the computational consequences were developed including a simple algorithm for problem (2). A special case when the programming problems were linear and seasonal was investigated. Problems (1) and (2) were also posed as dynamic programming problems in order to prove the existence of an optimal discharge schedule possessing the base-level property. (Kriss-Cornell)

DESIGN OF SEWER SYSTEMS,
Wisconsin Univ., Milwaukee. Coll. of Applied Science and Engineering.
J. M. Fisher, G. M. Karadi, and W. W. McVinnie.
Water Resources Bulletin, Vol 7, No 2, p 294-302, Apr 1971. 9 p, 4 fig, 7 ref.

Descriptors: *Optimization, *Linear programming, *Sewers, *Design, *Cost, Pipes, Constraints, Depth, Slopes, Size.
Identifiers: Iteration process, Algorithms.

The objective of this paper was to review and evaluate the merits of certain methods aimed at finding optimal solutions in sewer design. First, basic principles of sewer design were outlined. Then a linear integer programming algorithm, based on principles similar to the ones proposed by Deininger and Holland, was developed in which cost was expressed as a function of the pipe diameter and slopes. In order to show the application of the programming algorithm and to find out what difficulties are encountered in an actual problem, it was applied to an existing design of an interceptor sewer to be built in the Chicago metropolitan area and composed to a traditional approach. A computer program based on the SIMPLX method was developed to find the optimum pipe diameter, invert depths and slopes based on the objective cost function and subject to certain given constraints. An iteration process was used for the solution. The results of the optimization were summarized and a 10% difference was found between the results of the new algorithm and results of the traditional approach shown. In conclusion it was stated that this new optimization technique cannot be considered as substantial improvement with respect to traditional methods. (Kriss-Cornell)

FARM ANIMAL-WASTE MANAGEMENT.
Iowa State Univ., Ames. Dept. of Agricultural Engineering.

Miner, J Ronald (Ed). North Central Regional Publication 206, Special Report 67, May 1971. 44 p, 34 tab, 85 ref.

Descriptors: *Farm wastes, *Disposal, Waste water treatment, *Management, Hydroponics, Incineration, Pollutants, Diseases, Design criteria, Anaerobic digestion, Aerobic treatment, Aerobic bacteria, Zoonoses, Anaerobic bacteria, Farm lagoons, Chemical properties, Physical properties, Pathogenic bacteria, Environmental effects.
Identifiers: Composting, Oxidation ditches, Ruminant digestion, Nonruminant digestion, Disease transmission, Feedlot-runoff.

Current practices, technology, knowledge, and research results are summarized as related to the management and disposal or use of farm animal wastes in the 13 states of the North Central Region and other cooperating states. Among alternative systems of management and treatments described, attention is given to relative effectiveness in eliminating or minimizing detrimental environmental and ecological consequences. Detailed information is included on the biology and biochemistry of waste treatments; characteristics of animal wastes, including biological, physical, and chemical properties; aerobic, anaerobic, and combined treatments of animal wastes; composting, incineration, dehydration, and hydroponics; and actual and potential productive utilization of animal wastes. Needs for additional research are suggested. (Christenbury-Iowa State)

LEGAL ASPECTS PERTAINING TO ENVIRONMENTAL REGULATIONS IN PORK PRODUCTION,
Missouri Univ., Columbia. Dept. of Agricultural Economics.
Donald R. Levi.
American Pork Congress - Proceedings, Environmental Quality Workshop, Des Moines, Iowa, Mar 3, 1971. p 103-111.

Descriptors: *Farm wastes, *Legal aspects, Water pollution, Air pollution, Public rights, Regulation, Judicial decisions, Damages, Zoning, Permits, Maintenance, Water pollution control.
Identifiers: Public regulation, Private regulation, Nuisances, Legal principles, Lawsuits, Liability, Actual damages, Punitive damages, Site selection.

Public and private regulation of both air and water pollution is provided by pollution boards or commissions and through nuisance laws. Two lawsuits are discussed so that the legal principles involved might help determine what courses of action will help avoid such situations. In a nuisance law case the complaining party may ask for (1) an injunction, (2) damages (either actual or punitive), or (3) both an injunction and damages. The nuisances involved may be either public or private. A plaintiff may have a better chance if the rights of the public are being affected. Methods of avoiding lawsuits include the use of zoning, site selection, licensing, proper maintenance, adequate facilities, and being a 'good neighbor.' (White-Iowa State)

Salinity-source abatement.

This paper discusses salinity criteria for
Colorado River Basin. The problem faced in wa
quality management in the Colorado River Basi
one of improving existing mineral quality, o
least, minimizing future salinity increases. C
sumptive use of water in crop production co
plicates developing salinity criteria for
Colorado River Basin. There are only two di
approaches to implementing salinity criteria:
regulation of consumptive water uses and
desalination of waters whose salinity has been c
centrated by consumptive use. Three salinity c
trol approaches which do not necessarily dep
on the establishment of criteria are: the abatem
of salinity at selected sources including nat
sources, the augmentation of river flows, and
desalination of water for use. (See also W

INITY CONTROL IN RETURN FLOW M IRRIGATED AREAS - A DEMONSTRA- N PROJECT,
rado State Univ., Fort Collins. Natural urces Center.
nan A. Evans.
Water Quality Management Problems in Arid ons, Water Pollution Control Research Series, 0 DYY, 6/69, Oct 1970, USDI, Federal Water ity Administration, p 45-55. 7 fig.

riptors: *Salinity, *Return flow, *Irrigation, rado River, Salt balance, Canal seepage, Deep olation, Evapotranspiration, Electrical con- nce, Base flow.
ifiers: Salt load.

purpose of this paper was to summarize a nstration project which has been initiated in rand Valley area of Colorado for the purpose owing that saline agricultural return flows are ollable and that if improvements in water gement practices are applied, the salt load ning to the river will be reduced. A discussion en on the mechanics of return flow. Six irriga- ompanies, a power company, and a drainage ct combined resources to form a corporation he purpose of conducting the demonstration tudy. The first step was a before treatment in- ry of water and salt budget in the demonstra- area. Canal seepage losses have been mea- and a plan for lining certain sections is being lated. Many water flow measurements are made. Evapotranspiration estimates will be Groundwater flow will be calculated from ulic gradient and permeability data. Self- oring the Colorado River will afford the final nce of positive benefit from reduction in canal ge. The reduced canal seepage should reduce the volume of return flow, and affect a sig- nt reduction in salt load. (See also W71-) (White-Iowa State)

ER QUALITY CONTROL PROBLEMS IN ND SINKS,
al Water Pollution Control Administration, eda, Calif. California/Nevada Basins.
rd C. Bain, Jr., and John T. Marlar.
ater Quality Management Problems in Arid ns, Water Pollution Control Research Series, DYY, 6/69, Oct 1970, USDI, Federal Water y Administration, p 57-77. 8 fig, 2 tab, 10 ref.

iptors: *Water quality, *Salinity, *Sinks, phication, Fish, Dissolved oxygen, Tempera- Nutrients, Evaporation, Water level fluctua- Nevada, California.
fiers: Pyramid Lake (Nev), Salton Sea), Total dissolved solids, Surface area.

roblems of Pyramid Lake, Nevada, and Sal- a, California, are similar in many ways and ommon to other inland sinks. Salinity in- s and water level fluctuations attributable to and salt inflows and evaporation losses may ntrolled or abated through river basin and quality management schemes. Pyramid Lake levels and the rate of salinity increases can be lled by increasing the water supply to the Salton Sea salinity and water level problems better controlled by salt extraction, lower ir- n efficiencies in nearby agricultural areas, eading on developed parts of the shore, and le future evaporation pond operation. phication symptoms, advanced in the Salton d emerging in Pyramid Lake, are less easily ulated. Natural forces of deposition and con- ion of organic matter within these waters will o limit nutrient buildup; however trapping edation effects alone will not eliminate algal s. Control of eutrophication must begin with l or elimination of major nutrient sources. It r that unless water quality control measures ken, both bodies of water will eventually e aqueous deserts. Local, State and Federal efforts are underway to preserve or enhance the water quality and associated uses of these two in- land sinks. (See also W71-06111) (White-Iowa State)

WATER QUALITY STANDARDS: ENFORCEMENT AND COMPLIANCE,
Federal Water Quality Administration, Washington, D.C.
Murray Stein.
In: Electric Power and Thermal Discharges; Thermal Considerations in the Production of Electric Power. Gordon and Breach, New York, p 157-181, 1971.

Descriptors: *Water law, *Water Quality Act, *Regulations, *Thermal powerplants, Legislation, Water pollution control, *Standards.
Identifiers: Law enforcement, Temperature criteria.

The author presents the policy of the Federal Water Quality Administration and the Department of the Interior in the procedures for establishment of water quality standards and means of their enforcement in the USA. The Federal Water Quality Administration's concern is that all types of power generating units should be subject, insofar as practicable, to regulation on a similar and nondiscriminatory basis with respect to other industrial processes. All of the states included temperature criteria as part of their water quality standards submissions. Administration legislative proposals are also presented together with certification of standards compliance and the Water Quality Improvement Act of 1970. The three stage enforcement procedure - the conference, the public hearing and court action - is presented through the example of Biscayne Bay pollution with thermal discharges from one of Florida's power plants. PRACTICAL IMPLICATIONS OF APPLYING CRITERIA IN A VARIETY OF CONDITIONS,
Bureau of Sport Fisheries and Wildlife, Washington, D.C.
R. E. Johnson.
In: Electric Power and Thermal Discharges; Thermal Considerations in the Production of Electric Power. Gordon and Breach, New York, p 183-187, 1971.

Descriptors: *Thermal pollution, *Thermal powerplants, *Environmental effects, Water quality control, Heat, Beneficial use, *Standards.

The conglomeration of water standards admittedly is troublesome but may be inevitable. The attitude toward more rigid, higher standards is justified by our insufficient knowledge and the fact that we cannot afford risks with the biota. The destruction of an aquatic or terrestrial community by some environmental change may not seem important at times, but the community may not be replaceable in that area. The author polemizes with some of the popularized views pointing out that, for example, even brief entrainment of organisms through a cooling system may be harmful some distance below the discharge, or that heat is not always the only concern with metal ions and biocides present; or, that in some instances a few degrees of rise in water temperature can change a desirable fish fauna into an unacceptable group of species. There will never be a better time to plan, design and construct for future needs. The cost will never be lower and the long-term benefits will never be greater. DEVELOPING AND APPLYING STANDARDS AT THE STATE LEVEL,
Pennsylvania Dept. of Health, Harrisburg. Div. of Water Quality.
R. M. Boardman.
In: Electric Power and Thermal Discharges; Thermal Considerations in the Production of Electric Power. Gordon and Breach, New York, p 213-227, 1971. 2 ref.

Descriptors: *Standards, *Regulations, *Temperature, *Thermal pollution, *Cooling water, *Water quality control, Fish, Biota, Surface waters, Thermal powerplants, Nuclear powerplants, *Pennsylvania.
Identifiers: *Susquchana River, Fish pathways.

Pennsylvania's Sanitary Water Board thermal discharge regulations, adopted in 1961, are presented, followed by the discussion of water quality standards included in the amendment adopted in 1965. The heat content of discharges shall be limited to an amount that could not raise the temperature of the entire stream at the point of discharge 5F above ambient temperature or maximum of 87F, whichever is less; nor change the temperature by more than 2F during any one hour period assuming complete mixing. For a stream capable of supporting a cold water fishery, the maximum temperature is 58F, the increase remaining 5F. A fishway will be required in streams receiving heated discharges where this is essential for preservation of migratory pathways of game fish or for preservation of important aquatic life. ENVIRONMENTAL INFLUENCE ON POWER OPERATION,
American Electric Power Service Corp., New York.
John Tillinghast.
In: Electric Power and Thermal Discharges; Thermal Considerations in the Production of Electric Power. Gordon and Breach, New York, p 281-294, 1971.

Descriptors: *Water law, *Regulations, *Thermal powerplants, *Thermal pollution, Cooling, Heat, Environmental effects, Economic feasibility, Standards, Nuclear powerplants, Lake Michigan, Ohio River.

Due to low electric generation efficiencies, up to 75% of the potential chemical energy fails to be converted to electricity and must be rejected to the environment in the form of heat. Public opinion cannot expect power systems to be able to adjust their operation to limitations which are imposed by environmental regulations unless they are designed to do so. Attempts to conform operation to these limitations will result in compromises which, taken on the whole, are more detrimental than they are beneficial to the environment. In developing regulations, environmental considerations must be subjected to the same standards and scrutiny which we require of all technologies. They must be supported by experimental data, not be conjecture, and their economic ramifications must be carefully considered. (See also W71-08298) (Oleszkiewicz-Vanderbilt)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

USE OF LINEAR PROGRAMING FOR ESTIMATING GEOHYDROLOGIC PARAMETERS OF GROUNDWATER BASINS,
General Electric Co., Santa Barbara, Calif. Center for Advanced Studies.
David Kleinecke.
Water Resources Research, Vol 7, No 2, p 367-374, Apr 1971. 8 p, 1 tab, 8 ref. OWRR Project C-1339 (No 1971) (3).

Descriptors: *Simulation analysis, *Linear programming, *Hydrogeology, *Parametric hydrology, *Aquifer characteristics, Groundwater basins, Storage coefficient, Water storage, Permeability, Systems analysis, Mathematical models, Data collections, Data processing, California, Computer programs.
Identifiers: *Simulation models.

Simulation models of groundwater basins require that values be given for geohydrologic parameters such as permeability and storage capacity. These parameters may be estimated and later adjusted by trial and error to improve the ability of the model to simulate some known portion of the water history, or this process might be reversed to deduce geohydrology directly from the historical record. This suggestion was tested against a basin studied earlier by the California State Department of Water Resources. The fitting criteria used gave rise to linear programing formulations which were solved from the basin data. About one-third of the basin parameters were evaluated, but further development is required. It is believed that historical records, although apparently overdetermining the system of equations, actually underdetermine the system because of redundancy effects. The approach appears to offer the best known method for estimating the effective aquifer depth.

riptors: *Computer programs, *Statistical ods, *Flow control, *Flood, Streams, Input-ut analysis, Data.
ifiers: *Log-Pearson type III distribution, rithms.

adoption of a uniform method of establishing flow frequencies by use of the log-Pearson III distribution by the Water Resources Coun-as discussed. The objective was to obtain con-t estimates of flood frequencies. The method first transforms the natural data to their ithms and then computes the statistical neters. The basic equations associated with g-Pearson Type III distribution were included ugh it is not necessary to go through the ss of solving these equations since the dimen-ss probability distribution was provided in form. With the table available the primary em was determinization of logarithms of the s and the mean, standard deviation, and ness of the logarithms. The computer program was written in Fortran IV language and was in-d in the appendix. The example used illus-d the input and output data for annual floods o Minnesota streams. The log-Pearson Type tribution appeared to have an advantage over distributions commonly used in flood ency analysis in that it could be used with data g skewness coefficients other than one. To il-te its use, it was applied to selected streams in nited States. (Kriss-Cornell)

E EFFICIENT DYNAMIC PROGRAMMING ORITHMS FOR THE OPTIMAL SEQUENC-AND SCHEDULING OF WATER SUPPLY JECTS,
Western Reserve Univ., Cleveland, Ohio.
O. Esogbue, and Thomas L. Morin.
nical Memorandum No 192, Operations De-ent, School of Management, Case Western ve University, Contract DAHC 19-68-C-July 1970. 23 p, 3 fig, 2 tab, 3 ref, 2 append.

iptors: *Dynamic programming, *Optimiza-*Water supply, *Sequence, *Scheduling, Costs, Water demand, Project planning, Effi-ies.
fiers: Algorithms.

urpose of this paper was: (1) to show that the nic programming algorithm presented by er, Haimes and Hall for optimal sequencing ter supply projects, and referred to as DPI, be modified to solve a much more general of problems, the scheduling problem and (2) sent a more efficient dynamic programming thm, DP2, for solving both the sequencing and scheduling problem. The sequencing problem involved sequencing (timing) the construction completion dates of each of the N projects so that water demand will always be met and the sum of present costs of the N projects will be minimum. The scheduling problem considered was where N independent water supply projects were given and it was desired to select some subset of them to be constructed and then to sequence their completion times. A basic permutation schedule theorem was presented upon which DP2 was based and proof of the theorem was given in the appendix. The computational superiority of DP2 over DP1 for the sequencing problem was illustrated by solving a simple example posed by Butcher, Haimes and Hall. It was shown that the advantages of DP2 over DP1 increased size and complexity of a given problem. Efficient relevant algorithms capable of being utilized, with present day computational devices, to solve the problems encountered in water resources systems were produced. (Kriss-Cornell)

INTRODUCTION TO BAYESIAN METHODS USING THE THOMAS-FIERING MODEL,
Kansas City Univ., Manhattan.
W. J. Conover.
Supported by U. S. Geological Survey. Water Resources Research, Vol 7, No 2, p 406-409, Apr 1971. 4 p, 2 ref.

Descriptors: *Mathematical models, *Decision making, *Estimating, *Risks, *Correlation analysis, Investment, Computers, Dam design.
Identifiers: *Bayesian methods, *Thomas-Fiering model, Loss function.

A mathematical model was used to estimate unknown parameters of investment decisions in water resources. This Bayesian approach to estimation involved use of the estimator that minimized the expected risk, where risk was the expected loss. Bayes' estimators might be used in a wide variety of situations for which probabilistic models have been specified. In an example, a Bayes estimator of the serial correlation coefficient (p) in streamflow was shown to be a weighted average of the sample serial correlation coefficient (r) and the mean of all population serial correlation coefficients. The density of p was called the 'posterior density' when r was given, as opposed to the 'prior density' when r was not known. The posterior density was combined with the loss function to show that (1) if the loss function was the squared error loss function, the Bayes estimator was the mean of the posterior density; (2) if the loss function was the absolute deviation loss function, then the Bayes estimator was the median of the posterior density; and (3) if the loss function was almost constant then the Bayes estimator was the mode of the posterior density. Also, it was shown that the methods of Bayes' estimation do not lend themselves to numerical methods as performed on a computer. (Kriss-Cornell)

WATER AND AIR IN REGIONAL PLANNING (IN GERMAN).
Water Resource Association of Northwest Switzerland.

Schmassmann, Hansjorg (ed). Proceedings of the Third International Congress Pro Aqua, Basel Switzerland, 1965, Munich, R. Oldenbourg, 1967. 424 p, 166 fig.

Descriptors: *Water supply, Water pollution, Storage basin, Cost-benefit analysis, Regional analysis, Groundwater, Sewage disposal.
Identifiers: *Iso-economic point, Subsidy, Transportation cost.

This book contains the papers presented at the third International Congress PRO AQUA, 1965, in Basel, Switzerland, which dealt with problems of water and air in connection with regional planning. The larger part of the contributions concerns problems of water use and the planning of water supply. A major section considers questions of water quality, supply, and allocation as related to power plants. In a second section, large area and long-term planning of drinking and industrial water supply are discussed, in particular the topics include, groundwater protection, water supply, and regional and interregional water distribution. The remaining sections treat technical aspects of water use, waste water disposal and purification. (See also W71-08261 andW71-08262) (Siegenthaler-Rutgers)

THE ECONOMICS OF POLLUTION AND THE INTERDISCIPLINARY APPROACH TO ENVIRONMENTAL PLANNING,
Technische Hochschule, Darmstadt (West Germany).
Gerhard Kade.
International Social Science Journal, Vol XXII, No 4, p 563-575, 1970.

Descriptors: *Water pollution, Decision-making, Cost-benefit analysis, Resource allocation, Economic efficiency, Optimization.
Identifiers: *Environmental planning, Social cost, Externalities, Objective function.

Present methods of dealing with pollution and proposals of alternative strategy to environmental planning are considered. The author discusses traditional planning models and points out their inadequacies and implementation problems. The use of social costs and externalities in order to make an assessment of social loss attributable to air and water pollution is discussed. The author concludes the economist's use of taxes and subsidies as a solution to pollution is overly technological and neglects the social and political aspects of the problem. An interdisciplinary planning approach is presented to deal with environmental pollutants with the first step involving problem identification and the recognition of the interrelationship among pollutants. The second phase deals with the organization of the planning process and finally the solution to the problem and means of implementation are considered. This planning approach is designed to bridge the gap between program formulation and implementators through the continual involvements of environmental planners in all phases of analysis. (Siegenthaler-Rutgers)

APPLICATIONS OF MONTE-CARLO METHOD TO RESERVOIR DESIGN,
Institut fuer Wasserwirtschaft, Berlin (East Germany).
Siegfried Dyck, and Michael Schramm.
In: Proceedings of the International Hydrology Symposium, Sept 6-8, 1967, Colorado State University. Fort Collins, Colorado, Colorado State University Press, p 406-413, 1967.

Descriptors: *Monte Carlo method, Reservoir design, Correlation analysis, Gaging station, River flow, Regression analysis, Time series analysis.
Identifiers: *Autocorrelation, Residual mass.

The Monte Carlo method is applied to storage problems or reservoir design. The authors generate time series of discharge which satisfy the observed laws of river flow as a prerequisite to the application of the Monte Carlo method. The method used to generate the time series is that proposed by Svanidze and is a three stage process. First, a series of mean annual river flow is generated followed by a series of annual hydrographs. Combination of the two time series is made and correlation analysis then applied. The results of the correlation analysis are a series of generated monthly river flows which enter into the Monte Carlo calculation. Using the same method, it is also possible to generate parallel series of river flow for a network of rivers. (See also W71-08265) (Siegenthaler-Rutgers)

ON THE PROCESS OF BUDGETING: AN EMPIRICAL STUDY OF CONGRESSIONAL APPROPRIATION,
Carnegie Inst. of Tech., Pittsburgh, Pa.
Otto A. Davis, M. A. H. Dempster, and Aaron Wildavsky.
In: The Planning-Programming-Budgeting System: Progress and Potentials, Washington, The US Government Printing Office, p 263-322, 1967.

Descriptors: *Government, *Budgets, *Resource allocation, Statistics, Decisionmaking, Model studies, Time, Social aspects.
Identifiers: *Non-defense agencies, *Linear systems, Budget formation, Stochastic difference equations, Estimating procedures.

A study is presented of the processes through which government's apportion funds between alternative uses in allocating a significant portion of the country's resources. Simple laws are found, on the basis of statistical evidence, for the realized behavior of the process in at least half of the non-defense government agencies. For such agencies, certain linear systems of two stochastic difference equations are specified and fitted to time series data, with favorable results, suggesting that such systems accurately summarize certain aggregate outcomes of the budgeting process. Several models are presented, and their empirical results are analyzed in light of their limitations as alternatives in the decision making process. The criteria for determining a best specification for any agency from estimates of the alternative models is also considered. This article is valuable and relevant to the decision-making process involved in the budget formation for allocation of resources for water resource investment. (Murphy-Rutgers)

EVALUATION MODELS FOR REGIONAL DEVELOPMENT PLANNING,
Iowa State Univ., Ames; Manitoba Univ., Winnipeg; and Minnesota Univ., Minneapolis.
Jerald Barnard, James MacMillan, and Wilbur Maki.
The Regional Science Association Papers, Vol 23, p 117-138, 1969.

Descriptors: *Regional analysis, *Model studies, *Natural resource development, *Economic analysis, Measurement, Input-output analysis, Capital, Government, Technology, Costs, Income, Investments.
Identifiers: *Evolution models, *Social accounts, *Development program, *Economic growth, Interlake area, Market, Human resources.

This paper presents an evaluation model for measuring the impact of a regional development plan in the Interlake Area of the Province of Manitoba, the object being to determine if maximum benefits have been gained from the funds spent. The Interlake Area's problems concerned the adjustment of natural resources and human and social capital to changing market and technological conditions. A federal-provincial regional development program was to be evaluated for efficacy in local resource development, occupational adjustments, reduction of costs, and improvement in both the quality and range of choice in public and private services. The evaluation process involves a system of social accounts which includes both current and capital accounts for business and government and provides a basis for developing a dynamic model of the economy. A dynamic mathematical account is formulated which simulates the area's growth over time to serve as a basis for measuring and evaluating the development plan programs. The proposed model is designed to facilitate understanding of the impact of alternative programs, to promote regional development, and to develop a regional growth model. This model should be of interest to water research concerned with the analysis and evaluation of the effect of water resource investments on a regional economy. (Murphy-Rutgers)

THE SPECIFICATION OF REGIONAL ECONOMETRIC MODELS,
Pennsylvania Univ., Philadelphia.
Lawrence R. Klein.
The Regional Science Association Papers, Vol 23 p 105-115, 1969.

Descriptors: *Regional analysis, *Model studies, *Economic analysis, Income, Jobs, Rate of interest, Social aspects, Capital, Technology, Demand, Taxes, Prices.
Identifiers: *Econometrics, *Policy simulations, *Economic activity, Endogenous variables, Exogenous variables.

Econometric models generate regional variables of interest to state governments and businesses with limited market areas. The problem of industry models is presented as an analogous situation to the regional models in the discussion. The industry models selected are those of steel and automobiles. For each of these, the general structure of a plausible industry model is presented and endogenous and exogenous variables are delineated. It is then proposed that industries could be separately modeled in similar equation systems, which could then be linked consistently to a national aggregative model. Proposals for regional model building are similarly developed, and the static portions of the model relationships are specified in detail to support the concept of developing a particular model from a general one. Data requirements are discussed, and the drawbacks to the proposed method are juxtaposed with its advantages. This article is relevant to water research interested in analyzing the effects of water resource investment on a region as well as forecasting regional water demand. (Murphy-Rutgers)

APPLICABILITY AND LIMITATIONS IN THE USE OF NATIONAL INPUT-OUTPUT TABLES FOR REGIONAL STUDIES,
Cornell Univ., Ithaca, N.Y.
Stanislaw Czamanski.
Morgan Thomas (ed), The Regional Science Association Papers, Vol 23, p 65-77, 1969.

Descriptors: *Input-output analysis, *Regional analysis, *Model studies, Prices, Time, Demand, Economic analysis, Costs, Measurement, Data collection.
Identifiers: *Washington State, *Case study model, Field survey, Primary industries, Imports.

Research is presented that is designed to develop and test a regional model by adjusting national input-putput co-efficients that would eliminate all or part of the differences due to price changes over time, degree of fabrication, composition of demand, industry mix, and structure of imports. The research also aimed at determining which sectors could be handled by short-cut methods without destroying the forecasting value, and which sectors would require field study. The probable errors the case study model used were also analyzed, a compared with cost and time savings. The mo used was a Washington State table, and the res indicated that the methods yielded accepta results by considerably adjusting national inp output tables for purposes of regional studies. S methods excluded tertiary sectors through aggre tion and used field surveys to obtain input-out coefficients for primary industries and industrie which the regional economy is specialized. Th results are relevant to the economic analysis of gional water resources problems. (Murphy-R gers)

THE REGIONAL MUTIPLIER--SO PROBLEMS IN ESTIMATION,
Glasgow Univ. (Scotland).
K. J. Allen.
In: Regional and Urban Studies, Beverly Hills, S Publication, 1969, p 80-96.

Descriptors: *Regional analysis, *Forecast *Economic analysis, Statistics, Costs, Income, cial aspects, Taxes, Government.
Identifiers: Scotland, *Multipliers, Consump patterns, Employment, Savings, Purchases, gional leaks, Imports, Marginal propensities.

A discussion is presented of the meaning, uses, importance of the regional multiplier in regi economics and policy. The paper is relevan those areas of water resource analysis which mand a knowledge of the future of the regi economy in order to predict water demand. topics treated are national and regional multip the size of the multiplier, income and expend leaks, imports, and the use of marginal prop ties. As an illustration of the various concep value is given to the Scottish regional mult based on the assumption that all production are labor costs. This assumption permits the mation of the size of the mutiplier through an ysis of Scottish consumption patterns. The re are then criticized for accuracy of calculation comprehensiveness of analysis, and stress is to the importance of the regional multiplier analytical and forecasting tool in economic p making. ECONOMIC PLANNING FOR STAGED DEVELOPMENT,
Harza Engineering Co., Chicago, Ill. Resources Development Branch.
K. E. Sorensen, and R. D. Jackson.
Journal of the Hydraulic Division, Proceedings of American Society of Civil Engineers, Vol 94, No HY5, p 1231-1244, Sept 1968. 9 fig, 2 ref.

Descriptors: *Planning, *Costs, *Benefits, Investment, Projects, Water development, *Evaluation.
Identifiers: Staged development, Economic analysis, Criteria.

The engineering techniques and economic criteria for the planning and evaluation of staged development are discussed. The principal reasons for staged development are: evolving needs, limitations of investment capital, limitation of authorization, and limitations of basic data. Types of staged development include series of independent projects, series of interrelated projects, increment expansion of individual projects, planned obsolescence, and changes in project functions. Three principal economic factors which influence staged development are: (1) needs, goals, and benefit; (2) costs of water development; and (3) costs of non-water alternatives. The criteria that best suit analysis of staged development will relate to the rate of return on invested capital to the benefits achieved, or to the cost of alternative solutions. Two examples of economic analysis for staged development are given. It is a duty for the water resource planner to present a realistic evaluation of the economic merits of the water development and its alternations, as a guide to policy decisions. (Wang-Rutgers)

WATER,
LTA Ltd., Johannesburg (South Africa).
Henry Oliver.
Optima, Vol 20, No 2, p 58-67, June 1970. 4 fig, 6 tab.

Descriptors: *Water resources planning, *Multiple-purpose projects, *Water allocation (Policy), *Semiarid climates, *Dams, Hydroelectric power, Economic efficiency, Water users, Water costs, Evaporation, Irrigation practices, Irrigation efficiency, Planning, Consumptive uses, Industrial water, Effluents, Water quality control, Economic feasibility, Water consumption (Excludes consumptive use), Rainfall, Water assimulative capacity.
Identifiers: *South Africa.

Historically, dams have been built for agricultural purposes, but modern pressures on water supplies are so intense and conflicting that the accent is currently on inter-regional development requiring multipurpose dams. South Africa is a thirsty, semiarid region with low, sporadic rainfall and consistently high evaporation. Groundwater is limited and unreliable, but still provides supplies for 65% of the country's land area. Dam storage results in extremely high evaporation losses. Of all water-consuming sectors of the economy, agriculture is by far the greatest user. Due to limited river resources, lacking economics of scale and the need for great storage capacities because of environmental aridity, irrigation water development costs are extremely high. Surprisingly, this is not reflected in user costs and there is no incentive to achieve efficiencies in use. It is suggested that yields relative to development costs and water losses make arid lands irrigation developments impractical and that more attention should be given to irrigation projects which would stabilize and increase production in humid regions. Consumptive use criteria in planning river basin development in dry regions are inadequate and more attention should be focused on water rehabilitation. South African industrial use is much greater than statistics indicate because of the consumptive effects of effluent discharge. This must be ameliorated by better recycling and effluent elimination practices. Water price structures for industries and municipalities are also too low and should be reexamined. Ultimately water costs may exceed both price and value if the status quo is blindly maintained. (Casey-Arizona)

HUMAN RESPONSE TO RECURRENT DROUGHT IN NORTHEASTERN BRAZIL,
Colorado Univ., Boulder.
R. H. Brooks.
Professional Geographer, Vol 23, No 1, p 40-44, Jan 1971. 2 fig, 18 ref.

Descriptors: *Droughts, *Social impact, *Political aspects, *Economic impact, History, Water storage, Rainfall, Migration, Crop response, Semiarid climates.
Identifiers: *Starvation, *Northeastern Brazil.

The heavily populated semiarid northeastern region of Brazil has 2 seasons, a rainy winter and a dry summer. The population is composed mainly of unskilled laborers and peasants living at poverty levels and sustained by a semimarginal agriculture which is dependent upon the winter rains. These rains are not dependable as evidenced by a record of 36 droughts lasting 1-5 years between 1603 to 1958. The social results are calamitous. An estimated 2 million people died as a result of drought factors from 1877 to 1919. As a drought progresses, food supplies diminish, cattle herds starve and food prices progressively increase. In extended famines the people have eaten any animals or plants available, cooked or raw. Human physiological deterioration has in turn led to unchecked epidemics. The major sociological consequence has been in 2 forms of migration: micromigration, mainly from rural areas to villages and urban areas, and macromigration, which is mass flight to other parts of Brazil. Governmental responses in the past have been mainly characterized by unpreparedness and lack of concern, although some belated forms of assistance did occur. The author feels that these recurrent calamities require a major governmental assistance program, and there are indications that such a program is finally being developed. (Casey-Arizona)

A PERSPECTIVE OF CONTEMPORARY WATER PLANNING AND MANAGEMENT PROBLEMS IN UTAH,
Utah Water Research Lab., Logan.
J. M. Bagley.
Originally presented at the 7th Annual Engineering Symposium, Brigham Young University, Apr 16,

1966. Occasional Paper 3, Aug 1969. 26 p, 5 fig, 1 tab.

Descriptors: *Utah, *Inter-basin transfers, *Semiarid climates, *Water resources development, *Planning, Social aspects, Legal aspects, Political aspects, Geographical regions, Economic feasibility, Runoff, Precipitation (Atmospheric), Consumptive uses, Water consumption, Phreatophytes, Evaporation, River basins, Water conservation, Colorado River Compact, Water management (Applied).
Identifiers: *Central Utah Project, Central Arizona Project.

Approximately 15% of the total annual rainfall of Utah, or 9 million acre-feet, becomes stream flow runoff. This amounts to 8,000 gallons per person per day, yet Utah is considered a chronically water-short state. Hydrologically, the state is divided into 3 basins, the Columbia (1% total runoff) the Great Basin (57%) and the Colorado (42%). The apparent water shortage arises from 2 phenomena: (1) over 2/3 of the water is consumed by phreatophytes and evaporation (2) about 57% of Utah's water yield comes from Great Basin drainage while about 85% of water consumption occurs there, and only 15% in the Colorado River Basin, indicating a maldistribution of resources. Of 1.9 million acre-feet available to the state in interstate waters, only 579,000 acre-feet are currently used, leaving the rest to flow downstream in the Colorado River, or into Great Salt Lake from the Bear River. Additionally, many circumstances indicate future reductions in Utah's share of Colorado River waters, while demand projections indicate greater future needs for Colorado River water than the state's present allocation. The Central Utah Project is in the planning stages, and will involve a transbasin transport from the Vintah mountains, for municipal consumption purposes, into the heavily populated Bonneville Basin. It is argued that this is unrealistic since it will involve millions of dollars spent in planning to import water into an area which, from a hydrologic viewpoint, already has a water surplus. Instead, an effort must be made to overcome the political power of the norther region and move water into southern underpopulated parts of the state. The development alternative of spreading rather than concentrating water makes much more economic sense. (Casey - Arizona)

Identifiers: *Developing nations, *Technological effects, Ecological impact, *Oases, *Waterlogging.

In assessing the impact of man's exploding technology in dealing with desert water problems, desert water sources are briefly reviewed and methods of their utilization discussed. River types occurring in deserts ranged from low temporary to high perennial flows, in many areas, variously exploited by man for millennia. Groundwater is always an important water source of varying quality and such supplies may range from recently recharged reservoirs to the mining of fossil sources. Deserts are fragile ecosystems. Man's social structure is strongly influenced by his degree of adaptation, but this leads to the problem that the more he conquers his desert, the less the adaptation required but the greater the ensuing ecological disruption. In food gathering and hunting societies, which either directly or indirectly harvest the scant desert vegetation, social units are small wide-ranging ones having no major impact on desert ecology. Grazing societies, whether pastoral nomad or cowboy and sheepherder, also range over wide areas, but may wreak great ecological destruction through mismanaged overgrazing. Where scattered oases occur, an oasis agriculture may develop. This type of agriculture may be sustained by tapping groundwater supplies or by the creation of irrigation canals (such as Afghanistan's qanats). Modern technology has given rise to large-scale irrigation schemes involving local supplies or interbasin transfers. The problems arising from these schemes, particularly waterlogging and salinity, are discussed. It is maintained that alternatives must include adaptation as well as exploitation, including population control (Casey-Arizona)

Identifiers: *Developing nations.

A formal economic model is developed, with simplified assumptions, for utilization of land-water resources, using alternative optimizing guides. Since overpopulation and illiteracy are contributing factors to poverty, it has been no means clear that aridity per se causes low per-capita incomes. A recent study of 39 countries indicated that no significant difference could be found between semiarid and arid countries with reference to eith gross domestic products or growth rates. This situ tion is emphasized by widespread water wastage both developed and undeveloped arid nation Many underdeveloped countries are unable to ef ciently utilize modern inputs into agricultu because of insufficient education, and irrigat land is therefore not a limiting factor. A relat problem, particularly in developed countries su as the U.S. and Israel, is the desirability of devoti water to agriculture when there is demand for it alternative uses such as manufacturing or minir After examining the costs of new water fro several possible sources, it is concluded, with rea vations, that when alternatives to agriculture a available they are usually preferable. Such proje as water diversion into the Colorado Basin f agriculture are considered economically u realistic. Education is considered, together w water resource development, as important facto in the growth of many arid lands. However, ev large development schemes, such as the Asw Dam, have small effects on per capita income heavily populated countries. (Casey-Arizona)

REGIONAL AND INTERREGIONAL PLANS FOR WATER DISTRIBUTION (IN FRENCH).
Bureau of Water Protection, Neuchatel (Switzerland).
A. Burger.
Proceedings of the Third International Congress Pro Aqua, Basel, Switzerland, 1965. Munich, R. Oldenbourg, p 224-244, 1967.

Descriptors: *Water supply, Regional planning, Water demand, Water pollution, Capital investment.
Identifiers: *Subsidy, Recycling, Interregional planning, Transportation cost.

The problem of water distribution at the regional and interregional levels are considered. Since natural water supplies in regional areas are generally insufficient, the regional water supply must be conveyed by artificial means to compensate for seasonal fluctuations. Interregional water supply systems require high transportation costs for the conveyance of water supply as well as investment in supply equipment. The result is that the price of water increases. The author suggests that subsidies from the state may be necessary to cover part of the investment, thereby avoiding excessive pay-off rates. Subsidies are especially relevant for rural areas where the financial yield of the water supply is low. The future indicates that increased scarcity and pollution will necessitate industrial recycling of water supply. (Siegenthaler-Rutgers)

EFFECT OF WATER RESOURCE INVESTMENT ON ECONOMIC GROWTH,
Economic Research Service, Upper Darby, Pa.; and Franklin Inst. Research Labs., Philadelphia, Pa.; and Temple Univ., Philadelphia, Pa.
P. Thomas P. Cox, C. Wilford Grover, and Bernard Siskin.
Water Resources Research, Vol 7, No 1, p 32-38, Feb 1971.

Descriptors: *Water resource development, Economic evaluation, Regression analysis, Hydrology.
Identifiers: *Economic growth, Discriminant analysis, Growth index, Socioeconomic indicator, Principal component analysis.

An analysis was made of the effect of water resource development projects on the economic growth of small regions. Counties in the Northeastern United States in which large water resource development projects were constructed between 1948 and 1958 were studied to determine whether the projects did stimulate economic growth. An index of growth composed of fifteen variables was used as a dependent variable and tested for its relationship with other independent variables using stepwise regression and discriminant analysis techniques. The results indicated there was no relationship between project size and economic growth and the selection of project sites was biased toward urban areas where there is a greater likelihood of economic growth. The authors conclude that it is dubious whether water resource projects serve as a stimulus to economic growth for the strictly rural counties tested for the northeastern United States. (Siegenthaler-Rutgers)

INTERNATIONAL HYDROLOGY SYMPOSIUM,
Colorado State Univ., Fort Collins.
Vujica Yevjevich.
Proceedings, The International Hydrology Symposium, Sept 6-8, 1967, Colorado State University. Fort Collins, Colorado State University Press, 1967. 671 p.

Descriptors: *Hydrology, Flood control, Probability, Water balance, Forecasting, Streamflow, Monte Carlo method.
Identifiers: *Skewness, Parametric statistics.

This book presents the papers delivered at the International Hydrology Symposium held at Colorado State University, September 6-8, 1967. One of the objectives of the symposium was to stimulate new scientific ideas and advance research methods in hydrology. The main subjects considered were new models for parametric, dynamic, physical or analytical hydrology and the application of statistical methods from the physical and social sciences to the study of hydrology. Models dealing with flood forecasting, reservoir design, and streamflow were also presented at the symposium. (See also W71-08266 thru W71-08268) (Siegenthaler-Rutgers)

In: Proceedings of the International Hydrology Symposium, Sept 6-8, 1967, Colorado State University. Fort Collins, Colorado, Colorado State University Press, p 430-442, 1967.

Descriptors: *Regulation plan, Stochastic processes, Hydrology, Uncertainty, Decision-making, Water supply, Simulation analysis, Optimization, Probability distribution.
Identifiers: *Objective function, Autocorrelation, Clustering, Rule curve.

A stochastic approach to the regulation of the Great Lakes water levels and flows is presented. The hydrologic conditions of the Great Lakes have economic implications because competing uses including water supply, power development, and shore property interests. The regulation plan is considered as a sequence of decisions under uncertainty with the testing record generated by a stochastic process. The nature of this process is estimated from the historical record and the regulation plan is based on minimizing the probability of non-attainment of criteria developed from economic, technical, and social considerations. A multivariate model was used in the simulation analysis and the sequence generated were subjected to statistical tests such as clustering, frequencies, and autocorrelation to verify whether the properties of the recorded supplies were conserved. ON THE APPROPRIATE DISCOUNT RATE FOR EVALUATION OF PUBLIC PROJECTS,
Princeton Univ., N.J.
William J. Baumol.
In: The Planning-Programming-Budgeting System: Progress and Potentials, Washington, U.S. Government Printing Office, p 152-159, 1967.

Descriptors: *Rate of discount, *Economic efficiency, *Resource allocation, *Government, Investment, Capital, Risk, Economic analysis, Cost-benefit analysis, Government supports, Welfare economics.
Identifiers: *Opportunity costs, Private alternatives, Yield, Irreplaceable resources.

Various ramifications of ascertaining an appropriate discount rate for the evaluation of public projects are discussed. The significance of the discount rate is dealt with, and opportunity cost is presented as the basic criterion for the choice of the discount rate based on an economic analysis of the uses of cost-benefit principles. The importance of the discount rate is stressed, since at stake is the allocation of resources between the private and public sectors of the economy. Several other factors are dealt with in some detail, including the opportunity cost of consumer resources, the discount rate on resources from the business sector, the changes in rates on government bonds, the calculation of the rate of return on long-term bonds, and the future subsidy issue. A discount rate of no lower than 4.75 percent is proposed by the author to avoid misallocation of resources and economic inefficiencies. This article is particularly relevant for the allocation and evaluation of water resource investment. (Murphy-Rutgers)
W71-08269

DISCOUNT/INTEREST RATES IN EVALUATION OF PUBLIC INVESTMENT PROJECTS,
Banks (R.L.) and Associates, Washington, D.C.
Robert L. Banks.
In: The Planning-Programming-Budgeting System: Progress and Potentials, Washington, U.S. Government Printing Office, p 237-242, 1967.

Descriptors: *Investment, *Cost, *Government, *Economic efficiency, *Interest rate, *Water resource development, Rate of discount, Cost benefit analysis, Taxes, Time, Resource allocation, Social aspects, Budgets, Planning, Profit.
Identifiers: *Opportunity cost, Cost effectiveness, Social cost, Programming.

The question is discussed of the appropriate discount rate to be used in assessing the economic feasibility of government investment, particularly water resource projects. The presentation includes a brief historical background, the critical role of discount/interest rates in benefit-cost calculation, and an evaluation of the appropriate interest/discount rate. The social goal of government projects is stressed, and it is indicated that usually this principal goal will be the achievement of optimal allocation of scarce resources, rather than other purposes which can be achieved only at the expense of economic efficiency. To avoid distortions in the benefit/cost calculations to achieve these goals, the author proposes utilizing the opportunity cost principle in calculating the appropriate interest/discount rate. The use of a lower rate is incompatible with political and social philosophy, as well as economically indefensible in government water resource investment. (Murphy-Rutgers)

PROGRAM BUDGETING IN WISCONSIN,
Wisconsin, Legislature's Joint Committee on Finance, Madison.
John W. Reynolds, and Walter G. Hollander.
In: The Planning-Programming-Budgeting System: Progress and Potentials, Washington, The US Government Printing Office, p 243-248, 1967.

Descriptors: *Decisionmaking, *Budgets, *Government, Costs, Economic efficiency, Planning, Economic analysis, Financing, Evaluation.
Identifiers: *Program budget, *Policy-making, Wisconsin, Review process, Program goals, Subprograms.

The revised program budgeting system in Wisconsin is presented as an example of the efficient operation of a system based on systematic techniques for planning, reviewing, modifying and carrying out government programs. Program budgeting is defined and developed along with the underlying considerations of the program and the key factors for success. The program budget format is broken down into sub-programs, which permit review for relative accomplishment. The expected results include budget preparation on the basis of expected results, upgrading of the budget decision-making process, and substantial improvement in the ease of public comprehension and appraisal of responsible government. This proposal for effective overhaul of the government budget process has relevance for government investment in public works projects, including those in water resources. (Murphy-Rutgers)

EXTRACTIVE RESOURCES AND TAXATION,
Wisconsin Univ., Madison.

Mason Gaffney (ed), Madison, University of Wisconsin Press, 1967. 450 p.

Descriptors: *Natural resources, *Taxes, *Government, *Optimization, Economic analysis, Risk, Fisheries, Natural resource development, Social aspects, Economic efficiency.
Identifiers: *Extractive resources, *Resource policy, Exhaustibility, Resource exploitation, Oil, Timber, Distribution.

This book presents the various proceedings of a symposium on extractive resources and taxation sponsored by the Committee on Taxation, Resources and Economic Development at the University of Wisconsin. Exhaustible resources and their taxation are treated as important links in the development of economic and fiscal theory and policy, the use of taxation being the assertion of public interest in the natural resources. The various articles included in the book appear in a manner designed to present all aspects of taxation of natural resources, and to advance proposals for such taxation under conditions of exhaustibility. The book divides the problem into overlapping areas of economic theory, economic institutions and economic policy which deal with such problems as resource depletion, resource exploitation, resource control, natural resource allocation, distribution and taxation. These topics are of special interest to research in water resource development. (See also W71-08274 thru W71-08275) (Murphy-Rutgers)
W71-08273

ECONOMIC THEORY AND RESOURCE POLICY,
Purdue Univ., Lafayette, Ind.
Irving Morrissett.
In: Extractive Resources and Taxation, Madison, The University of Wisconsin Press, p 295-31 1967.

Descriptors: *Natural resources, *Economic analysis, *Resource allocation, *Planning, Prices, Time, Government, Costs, Marginal cost, Taxes, Benefits, Social aspects, Income, Welfare economics.
Identifiers: *Public planning, Subsidies, Externalities, Cartelization, Market system, Competitive, Price theory.

A broad public policy for exhaustible resources presented in the setting of a policy for all natural resources. Particular attention is given to the role of controls, taxes, and subsidies in supplementing the price system. Price theory, competition theory and welfare theory are also utilized in the discussion. Several means are suggested to modify and supplement the operations of the imperfectly competitive market system of natural resources. Included in the remedies proposed are increased discussion and research on the social goals of the economy, taxation on the value of resource development of a technically feasible appropriate unit for natural resources, and better measurement of cartelization externalities of production. Further suggestions include avoidance of resource industries, use of long-run marginal cost as a basis for pricing all resources, use of justifiable subsidies for growth, and restriction of the time horizon for planning for public uses of natural resources. These points are relevant to all natural resources planning areas, including water resources. (See also W 08273) (Murphy-Rutgers)

OPTIMIZATION AND TAXATION IN OPEN-ACCESS RESOURCE: THE FISHERY,
Columbia Univ., New York. Graduate School of Business.
Giulio Pontecorvo.
In: Extractive Resources and Taxation, Madison, The University of Wisconsin Press, p 157-1 1967.

Descriptors: *Optimization, *Taxes, *Fisheries, *Government, *Resource allocation, Economic analysis, Population, Economic efficiency, Models studies, Price, Fish protein, Benefits, Income.
Identifiers: *Maximum physical yield, Market mechanism, Treaties, Constraints, Welfare, Inability, Valuation.

This article discusses the economic theory of fisheries, considering fisheries as a case where the market mechanism under normal (i.e. competitive) conditions fails to provide the proper allocation of resources. The problems associated with the accepted optimum of maximum physical yield are surveyed and the recent models integrating biological yield functions with economic conditions of production are presented. The various difficulties of these models are also discussed, particularly in light of their effect on fishing treaties. Recent theoretical developments of the fishing optimization problems are presented, with particular attention being given to the structural issues of instability and valuation. The conditions under which a developed fishery will provide a positive net economic yield are delineated and various taxation difficulties are discussed in relation to these conditions. Alternative means of taxation and valuation to reach the optimal goal are suggested in addition to methods of selecting the best means for a particular fishery. (See also W71-08273) (Murphy-Rutgers)

PROFESSIONAL DECISION-MAKING,
Rand Corp., Santa Monica, Calif.
James R. Miller.
New York, Praeger, 1970. 305 p.

riptors: *Decision-making, Operations rch, Systems analysis, Optimization, Risk, omic evaluation, Resource constraint, Cost.
ifiers: *Worth assessment, Sensitivity analysis, vorth, Cardinal utility, Capital budgeting.

book considers the subjective part of decision-ng, worth assessment, and decision-making sses. Worth assessment is outlined as a syste-ed procedure rather than subjective process gh the use of the concept of an assessment ure. Operations research, decision-theory, ystems analysis is used to derive the assess-structure. An experiment was performed to te the assessment procedure and to deter-whether professional decision-makers were to achieve successful implementation. The dure was empirically validated. The resulting assessment is integrated with resource con-ts to arrive at a final decision using a decision hat chooses the most feasible alternative with ghest worth score. The decision procedure is ded via sensitivity analysis to generate com-l alternatives or include uncertainty. This is relevant to water research concerned with on making processes. iers: *Economic growth, *Economic pment, *Social scientists, Fiscal policy, Ex-ics.

ral survey is presented of social science ap-cs to planning problems in British regional and urban studies. A brief historical development of social scientists' participation in such planning is presented and contrasted with recent planning and planning thought, which is arbitrarily assumed to be post-1960. Particular attention is given to the dissatisfaction of pre-1960 planning and the need for the development of economic planning to deal with specific difficulties, such as those caused by population overspill, and innovative transportation techniques. Special attention is given to the relationship between the goal of growth and the development of under-utilized resources through public expenditure. The change in scope from urban to regional boundaries is also discussed in some detail. This article is relevant to research interested in the relationship of water resource development to regional economic growth. (See also W71-08281) (Murphy-Rutgers)

CAPITAL BUDGETING, A QUANTITATIVE EVALUATION OF INVESTMENT ALTERNATIVES,
Stanford Univ., Calif.
Robert V. Oakford.
New York, The Ronald Press, 1970. 276 p.

Descriptors: *Economic evaluation, Decision-making, Probability theory, Cost-benefit analysis, Risk, Budget constraint, Random variable.
Identifiers: *Capital budgeting, Sensitivity analysis, Present worth, Cash flow.

This book presents a discussion of capital budgeting, emphasizing the quantitative measures used in evaluating investment alternatives. The author defines the classical measures of worth: present worth, cost-benefit ratio, growth rate and cash flow and then discusses their relative strengths and weaknesses. Problem situations where decision-making occurs under conditions of uncertainty are considered along with the analysis of the criteria to be used in project evaluation. Sensitivity analysis is used to deal with uncertainty. Another approach used is the expression of uncertainty in terms of random variables, a method based on probability theory. Benefits and costs of prospective projects also are expressed as random variables for the decision-making process. This book is relevant to water research involved in capital budgeting decisions and project evaluation and selection. (Siegenthaler-Rutgers)

WATER, EARTH, AND MAN.
Cambridge Univ. (England).

Richard J. Chorley, ed. London, Methuen and Co., Ltd., 1969. 588 p.

Descriptors: *Hydrology, *Resource allocation, Cost-benefit analysis, Budget constraint, Systems analysis, Evapotranspiration, Surface runoff, Groundwater, Flood control.
Identifiers: *Water resource systems, Objective function, Opportunity cost, Capital cost.

This book presents a series of essays concerned with the theme that the study of water provides a logical link between an understanding of physical and social environments. Each chapter develops this theme by proceeding from the many aspects of water occurrence to a deeper understanding of natural environments and their fusion with the activities of man in society. Water is viewed not only as a commodity used by man but also as the mainspring for economic development and also a formative factor in the physical and biological environment as well. There is a description of techniques and new methods of analysis as applied to the water-resource field by social and physical scientists. (See also W71-08291 thru W71-08293) (Siegenthaler-Rutgers)

THE ECONOMIC AND SOCIAL IMPLICATIONS OF SNOW AND ICE,
Southern Illinois Univ., Carbondale.
J. Rooney.
In: Water, Earth, and Man, London, Methuen and Co., p 389-401, 1969.

Descriptors: *Economic evaluation, Water supply, Recreation streamflow, Cost-benefit analysis, Correlation, Decision-making.
Identifiers: *Snow zone management, Snow costs, Utility function.

Estimates are considered of the contribution of snow to agriculture, recreation, and domestic and industrial water supply. The cost of snow-caused disruption and loss of life are evaluated as well. The economic impact of snow-zone water on California and the Western United States agriculture is found to be significant both because of the value of snow as a water-supply source and its dependability in yield. The economic importance of snow-based recreation activity is discussed along with projections of increases in demand. The author finds the most detrimental economic effect of snowfall to be the disruption of communications and allied services. Data on snow disruption is categorized by urban area and impact on various activities. The author suggests the need for systematized decision-making to reduce snows cost of disruption. (See also W71-08290) (Siegenthaler-Rutgers)
W71-08291

HUMAN RESPONSE TO FLOODS,
Victoria Univ. (British Columbia).
W. R. Derrick Sewell.
In: Water, Earth, and Man, London, Methuen and Co, Ltd, p 431-451, 1969.

Descriptors: *Flood control, *Flood plain insurance, Risk, Flood plain zoning, Economic efficiency, Floodproofing, Cost-benefit analysis.
Identifiers: *Subsidy, Natural tax.

The changing patterns of responses to floods are examined. The author groups the possible adjustments to floods into the following categories: loss acceptance, public relief, emergency action, structural change, flood proofing, land use regulation, flood insurance, and flood control. However, only a few of these possibilities are considered in flood-management decision-making with the result that adjustment is much less efficient than if the full range is consulted. The Lower Fraser Valley in British Columbia is used as a case study of responses to a major flood problem. The author finds first that the adjustment to floods in this region is corrective but no preventive and secondly, there has been an increase in the share of costs of flood protection borne by the national government. The author concludes the Fraser River experience suggests that concentration on a narrow range of alternatives may lead to inefficient adjustment, and furthermore, flood losses covered by public subsidy induce firms or activities to locate in areas of substantial flood hazards. To alleviate these problems, a system of flood plain zoning, flood proofing and flood insurance is advised. (See also W71-08290) (Siegenthaler-Rutgers)
W71-08292

CHOICE IN WATER USE,
Simon Fraser Univ., Burnaby (British Columbia); and London Univ. (England).
T. O'Riordan, and Rosemary J. More.
In: Water, Earth, and Man, London, Methuen and Co., Ltd, p 547-573, 1969.

Descriptors: *Resource allocation, *Pollution abatement, Water supply, Recreation, Water resource management, Flood, Protection, Cost-benefit analysis, Systems analysis, Risk.

Identifiers: *Externalities, *Opportunity cost, Objective function, Time horizon, Capital cost.

Various techniques used in water resource management are considered for allocating water for multipurpose use and for integrated river-basin development. The purpose of allocation techniques is to discover for any given project the maximum net benefits and to weigh the relative merits of alternative projects. The evaluation process for a multipurpose water-resources system is complicated by problems of collective benefits, externalities, intangibles, uncertainty and opportunity cost. The two approaches to water resource allocation discussed are cost-benefit analysis and systems analysis. The advantages and disadvantages of each method are evaluated. These allocation techniques provide a range of possible choices with the actual decision resting in the political institutional process. Decision-makers are faced with physical, fiscal, and legal constraints. Examples are given to illustrate various institutional approaches to water-resource-allocation decision-making. CAPITAL BUDGETING: A MODIFIED APPROACH TO CAPITAL ALLOCATION,
Oregon University, Eugene, Oregon; and Sacramento State College, Sacramento, California.
Leslie P. Anderson, and Vergil V. Miller.
Management Accounting Vol 50, p 28-32, March 1969.

Descriptors: *Decision-making, *Economic evaluation, Risk, Resource allocation, Interest rate, Discount rate.
Identifiers: *Capital budgeting, *Cumulative present value, Opportunity cost, Payback, Present value, Cash flow.

A modification is considered for the present value approach to investment decision making that enables the decision maker to visualize the impact of each variable on the decision making process. The suggested approach is cumulative present value which provides all the benefits associated with the use of the payback criterion as well as those of the more theoretically correct methods of project evaluation such as present value. Cumulative present value shows payback in discounted dollars and compares the discounted income streams of alternative proposals with equal present values. Examples are given that apply the cumulative present value method to investment proposals of varying life expectancies and time periods. This article is relevant for water research concerned with the evaluation of project proposals. (Siegenthaler-Rutgers)

REGIONAL INFORMATION DESIGN FOR PUBLIC DECISIONS,
California Univ., Los Angeles.
Werner Z. Hirsch.
Review of Income and Wealth, Series 15, No 4, p 369-380, Dec 1969.

Descriptors: *Decision-making, Regional analysis, Input-output analysis, Cost-benefit analysis, Resource allocation.
Identifiers: *Horizon scanning, Opportunity cost, Equity.

The use of regional information systems are considered as a tool toward improving the quality of policy decisions at the regional level. There are three components of regional information systems: policy-oriented information design, data banks, and analytic models. The information system presented in this paper is based on decision rules that relate to a horizon scanning decision process for uncovering future problems and opportunities. An example is given of the regional information system that classifies the environmental and program information and depicts alternatives futures and potential areas of concern for regional decision-making. This article is relevant to water research concerned with predicting regional water problems and contribution to the evaluation and solution of these problems. (Siegenthaler-Rutgers)

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

ECONOMIC EVALUATION OF WATER SUPPLY PRICING IN ILLINOIS,
Illinois Univ., Urbana.
Hamdy H. H. Afifi.
Journal American Water Works Association, Vol 61, No 1, p 41-48, Jan 1969. 5 fig, 2 tab.

Descriptors: *Evaluation, *Marginal costs, Water rates, *Costs, Water demand, Elasticity, Analysis.
Identifiers: *Water supply pricing, Community growth, Block rate, Flat rate.

This study analyzed rate-making policies in Illinois and suggested a two-part seasonal rate structure to reflect the economic factors involved. The block rate was commonly used in Illinois, and it was reported in 84.5 per cent of the water rate schedules. The factors affecting water supply prices in Illinois were exposed to a regression model to determine the degree and significance of their relationship to actual charges. The cross-section data on the economic characteristics of the water utilities, the water rate charges, and the economic activities were incorporated into the analysis. The water supply's expected future demand in 1975 was analyzed in terms of different customer class demands, as well as overall water utility demand. The analysis revealed that population served is the primary basis for the expected growth. The economic evaluation of current water rates is concluded with a proposed water rate schedule that can give maximum effect to marginal cost pricing principles as well as the industry's financial requirements. Other study recommendations were discussed. (See also W70-02391) (Wang-Rutgers)

SURFACE SUPPLY COSTS MORE, FARM H REAU SHOWS,
Farmers Home Administration, Champaign, Ill.
D. H. Stoltenberg.
Water and Wastes Engineering, Vol 8, No 2, p 32, Feb 1971. 3 tab.

Descriptors: *Costs, *Operation and maintenan Rural areas, Economics, Water supply.
Identifiers: FHA, Surface supply.

The average operation and maintenance cost water systems for communities smaller than 1 population are discussed. The Farmers Home ministration (FHA) of Illinois has obtained sc results by collecting and analyzing statewide d for both FHA and non-FHA financed water syst including well supply, surface supply, and syst that purchase treated water from another com nity. Tabulated data included average opera and maintenance costs for both FHA and non-F financed water system, and breakdown of op tion and maintenance costs for FHA finan water system. It concluded that purchased w and well supply rank next to surface supply average monthly operation and maintenance c in rural areas, and the average operation and m tenance cost was less per user for the non-F systems than for the FHA systems. AGE BASINS FOR WATER SUPPLY,
heshire Water Board (England).
n Davies.
edings of the Third International Congress
qua, Basel, Switzerland, 1965. Munich. R.
nourg, 1967, p 209-223.

ptors: *Water supply, *Storage basin, Water
ce planning, Reservoir storage, Flood con-
ntrol, Cost-benefit analysis, Forecasting.
iers: *Iso-economic point, Pumped storage

This paper considers some complex and interdependent factors that affect long range planning of a safe and adequate water supply. The author considers four types of storage basins to satisfy future water supply: reservoir basin, pumped storage basin, artificial basin, and a river control scheme. The economic and geographic merits of each scheme are considered in a cost-benefit framework. The storage basin should be planned and completed so that the iso-economic point (where water consumption and drought exceed water supply) is not reached. However, forecasts of water consumption should not neglect water costs arising from scarcity and pollution. The author finds that only through integrated planning of new storage basins for water supply, flood control and other societal needs, can the maximum benefits be achieved. UNIQUENESS OF THE INTERNAL RATE OF RETURN WITH VARIABLE LIFE OF INVESTMENT,
Stanford Univ., Calif.
Kenneth J. Arrow, and David Levhari.
The Economic Journal, Vol LXXXIX, No 315, p 560-566, Sep 1969.

Descriptors: *Economic evaluation, Capital investment, Interest rate, Discount rate, Project planning.
Identifiers: *Internal rate of return, Present value, Truncation period.

The use and limitations are considered for the internal rate of return as a selection criterion among investment projects. Previous work has indicated that an investment can have multiple internal rates of return if some of the net yields are negative. Maximization of present value with given rates of discount is then recommended as an alternative guide to project selection. The authors show that if there is a constant discount rate and a choice of the truncation period for the project that maximizes present value, then the internal rate of return for the truncated project will be unique. In addition, the authors find that if the life of the project is optimally chosen, then the maximized present value of the project is a monotonic decreasing function of the rate of interest. This article is relevant to water research concerned with decision-making and project selection. (Siegenthaler-Rutgers)

HIGH PLAINS IRRIGATION AND TEXAS WATER PLAN,
Texas Technological Coll., Lubbock.
D. M. Wells.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 97, No IR1, p 123-130, Mar 1971. 4 tab, 7 ref.

Descriptors: *Irrigation, *Benefits, Value, Costs, Projections, Economics, Pumping.
Identifiers: *High Plains, *Secondary benefits, *Tertiary benefits, Farm income, Agriculture, Farmers.

The economy of the High Plains of West Texas is strongly dependent upon irrigated agriculture. Without the Texas Water Plan, or some similar plan for the importation of water to the High Plains, irrigated agriculture in the High Plains will shortly start a decline that will end in oblivion in less than a century. Of far greater significance will be the decline of secondary and tertiary benefits to other sectors of the economy. Secondary and tertiary benefits associated with irrigation had been estimated to range from about four times the primary benefits in a dry year to about seven times the primary benefits in a reasonably wet year. Current status of irrigation in High Plains, value of irrigation to the High Plains economy, and present cost of irrigation water in High Plains were discussed. It concluded that water should be imported to the High Plains to sustain and enhance the present level of irrigated agriculture in the area. (Wang-Rutgers)

ALTERNATIVE USES OF ARID REGIONS,
Ministere du Developpment Industriel et Scientifique, Paris (France). Direction du Gaz et de l'Electricite.
Georges Drouhin.
Presented at an international conference, 'Arid Lands In a Changing World,' Tucson, Arizona, June 1969. In: Arid Lands In Transition, Dregne, H E (ed), Pub No 90, AAAS, p 105-120, 1970. 7 fig.

Descriptors: *Agriculture, Water resources development, *Arid lands, *Tourism, *Mining, Sedimentary basins (Geological), Groundwater, Semiarid climates, Social aspects, Soil types.
Identifiers: *Sahara Desert, *Oases, *Fossil soils.

Semiarid and arid lands are generally faced with 3 critical problems: water scarcity, prohibitively expensive power costs, and saline water and soils. Semiarid areas are generally not inhospitable since they usually have some reliable water sources and support extensive agriculture. They are generally amenable to economic development and some sedentary settlement. Arid lands (deserts) are extremely variable, geologically and geographically. Most discussions are confined to the Sahara Desert. The author feels agriculture, mining, and tourism are important areas of potential desert development. The extensive sedimentary basins indicate large aquifers and many artesian zones. Groundwater depletion will probably not be a major problem in the near future. Oasis agriculture should probably concentrate on date palms. The presence of fossil soils indicates a wider distribution of cultivatable soils than formerly thought. In most, but not all areas, water resources are probably adequate to support mining operations. (Casey-Arizona)

AN INTERREGIONAL DEMAND-SUPPLY MODEL FOR WATER RESOURCE DEVELOPMENT,
New Mexico Univ., Albuquerque.
Nathaniel Wallman.
Morgan D. Thomas (ed), The Regional Science Association Papers, Vol 19, p 111-122, 1967.

Descriptors: *Water demand, *Water supply, Water resource development, *Model studies, *Irrigation, *Marginal cost, Agriculture, Surface runoff, Rivers, Population, Watersheds, Fish, Recreation, Effluents, Waste treatment.
Identifiers: *Chile, *Marginal cost constraint, Hydrologic definition.

A demand-supply model based an a study of Chilean water resources is presented. However, the method can be applied in other countries as well. The characteristics of the various water resources are presented, and their distribution and uses are discussed. The construction of the interregional water resource model is delineated, with special attention being given to water regions, water requirements and water supplies, as well as water quality. Factors of flow, requirements, and supply functions of the water resources are presented by provinces, and defined both hydrologically and economically. The results of the model include comparisons between physical requirements and physical supplies, assumptions of optimal water resource development limitations, effects of marginal cost constraints, and various alternative allocation adaptations to water shortages. Projections for future procedures also resulted, focusing particularly on the problems of relating water regulation to the Chilean agricultural sector. (Murphy-Rutgers)

6E. Water Law and Institutions

UNITED STATES OCEANS POLICY: AN ANALYSIS,
Leigh S. Ratiner.
Journal of Maritime Law and Commerce, Vol 2, No 2, p 225-266 (1971). 42 p, 71 ref.

Descriptors: *International waters, *International law, *Oceans, *United States, Continental margin, Treaties, United Nations, Foreign countries, Continental Shelf, Beds, Coasts, Fishing, Commercial fishing, Navigation, Mineralogy, Oil, Fisheries, Technology, Exploration, Exploitation, Natural resources, Law of the sea, Water pollution, Beaches, Military aspects.
Identifiers: *Territorial sea.

Analyzing the oceans policy of the United States, as enunciated by President Nixon and proposed in a draft convention on the international seabed area, this article examines the problem from four perspectives: (1) historical, (2) United States national interests, (3) foreign national interests, and (4) international interests. The article first traces the proliferation of unilateral declarations by nations regarding their jurisdiction over adjacent sea areas. The resulting chaos has brought about efforts to reach an international agreement on the territorial sea and other rights in sea areas. Secondly, the article lists the various United States interests in oceans which include fishing, natural resources exploitation, pollution, military considerations, and navigation. The third section deals with the varying interests of foreign nations, categorizing nations into groups which reflect their geographic and economic situations regarding seabed jurisdiction. The final section considers the international community's interest in oceans and examines specifically the new United States policy and proposed international convention on the seabed area. The United States proposal covers: (1) the territorial sea, (2) the continental shelf boundary, (3) rights in living resources of the sea, (4) rights in mineral resources of the seabed, and (5) navigation through international straits. It creates international machinery to govern the seabed area, balances various interests, and serves as a basis for further negotiation. (Duss-Florida)

STATEMENTS ON PROPOSED FEDERAL ACTIONS AFFECTING THE ENVIRONMENT.
Council of Environmental Quality, Washington, D.C.

Federal Register, Vol 35, No 92, p 7390-7393 (May 1970). 4 p.

Descriptors: *Administrative agencies, *Legislation, *Environment, *Ecology, Administration, Budgeting, Coordination, Legal aspects, Decision making, Federal government, Regulation, Governments, State governments, Environmental effects, Federal budgets, Local governments.
Identifiers: *National Environmental Policy Act of 1971.

Pursuant to section 102 (2) (c) of the National Environmental Policy Act of 1971 and Executive Order 11514, the Council of Environmental Quality herein proposes the procedures to be followed by all federal agencies in complying with the Act. Types of agency actions which may require the preparation of environmental statements providing timely public information on federal plans and programs with environmental impact are discussed and defined. A procedure for legislative proposals and recommendations is also outlined. This memorandum specifies the required content of environmental statements. Federal agencies with expertise or jurisdiction in applicable areas are to be consulted in connection with the preparation of environmental statements. There are also provisions for state and local review of proposed action. These environmental statements are to be used in agency review processes and made public. Federal agencies will review their existing authority to determine whether there is anything which prohibits their full compliance with the National Environmental Policy Act and shall make proposals to bring their authority and policies into compliance with the Act. (Robinson-Florida)

WATER POLLUTION,
Peter J. Ryan.
Albany Law Review, Vol 35, No 2, p 198-218 (1971). 21 p, 145 ref.

Descriptors: *Water pollution control, *Water pollution, *Pollution abatement, *Regulation, Waste water (Pollution), Water law, Federal government, State governments, Local governments, Legal aspects, Legislation, Interstate commissions, Thermal pollution, Wastes, Water quality, Water quality control, Water Quality Act, Water treatment, Sewage disposal, Waste treatment, Sewage treatment, Rivers and Harbors Act, Judicial decisions.

Discussed in this article are the various types of water pollution including mercury, phosphate detergents, and thermal pollution and regulation thereof. The water pollution problems of New York City are examined, particularly the Jamaica Bay ecological study and the city's water supply. The article traces the development of common law for the control of water pollution with emphasis on several important cases. Water pollution regulation by the following governmental bodies is also examined: (1) New York City; (2) Interstate Sanitation Commission of Connecticut, New Jersey, and New York; and (3) federal agencies. The Rivers and Harbors Act of 1899, Federal Water Pollution Control Act, and the Water Quality Act of 1965 are evaluated as examples of federal control. The problems of enforcing anti-pollution laws are examined, and the Michigan statute granting to
private citizen the right to sue pollutors on be
of the general public is discussed. The author f
that a well-informed and concerned populace is
most potent weapon in the fight to save our
vironment. (Robinson-Florida)

lments, Reservoirs, River regulation, United
, Georgia, River basins, Water control, Water
e, Hydroelectric plants, Federal government,
ation, Economic impact, Judicial decisions,
aspects, Multiple-purpose projects.

iff United States brought action to condemn
rty for construction of a regulation dam and
ndment area. Plaintiff contended that the
vas part of a larger hydroelectric power pro-
nd that, as such, defendant landowner should
e for compensation the value of the lands
mned without an allowance for enhanced
due to proximity to the project. Defendant
wner contended that the regulation dam was
ithin the original scope of the project, and
e value of the land should include its value as
ced by the factor of proximity. On the
inary motion, the United States district court
that evidence as to enhanced value of the
vas admissible. The court noted that long his-
f the power project, during which the regula-
dam concept had been rejected. After a
ct tract has been condemned, the govern-
at a later date, must pay the market value of
ldditional land as enhanced by proximity to the
al project, unless such additional land was
mplated as a part of the original plan. (Smil-
-Florida)
07712

**ED STATES V 901.89 ACRES OF LAND
UE OF RETAINED LAND ENHANCED BY
DEMNATION FOR PUBLIC PROJECT).**
2d 395-401 (6th Cir 1970).

iptors: *United States, *Condemnation
*Land appraisal, *Appreciation, Impounded
, Condemnation, Eminent domain, Compen-
, Economic impact, Dams, Damsites, Lakes,
shores, Aesthetics, Appraisals, Recreation,
control, Boundaries (Property), Judicial
ons, Federal government, Legal aspects.

iff United States brought condemnation
edings against defendant landowner. Plaintiff
nded that an award for compensation of the
ondemned for construction of a dam should
nto consideration the enhancement of value
ined land due to its proximity to the created
Defendant contended that enhancement of
ed land value was a general benefit which was
be considered in awarding compensation. In
ing a lower court award for defendant, the
d States Court of Appeals, Sixth Circuit, or-
that the increase in value of retained land
proximity to the lake should be considered
rding compensation. The court distinguished
general benefits, which arise from the fulfillment of the public object that justified the taking, and special benefits that arise from the peculiar relation of the land in question to the public improvement. General benefits are not included in valuation of retained land, but special benefits are properly included. The proximity of retained land to a created lake falls within the category of a special benefit. (Smiljanich-Florida)

ENVIRONMENT,
Richard M. Nixon.
116 Cong Rec H 743 (daily ed) 2 US Code Cong and Admin News, p 112-123 (1970). 12 p.

Descriptors: *Environment, *Water pollution control, *Air pollution, *Water pollution, Parks, Recreation, Water pollution sources, Cities, Industry, Farm wastes, Agricultural chemicals, Real property, Administrative agencies, Administrative decisions, Administration, Pollutants, Pollution abatement, Ecology, Federal project policy, Environmental effects, Solid wastes, Waste disposal.

President Nixon's 1970 environmental message to Congress discusses pollution abatement measures in several areas of environmental deterioration. Water pollution is stated to have three principal sources: (1) municipal, (2) industrial, and (3) agricultural. Surprisingly, pollution from agricultural sources is considered the most troublesome. The phaseout of DDT is cited as an action taken to abate agricultural pollution. President Nixon proposes various means of abating municipal pollution, including creation of an Environmental Financing Authority to assist municipalities in selling waste treatment construction bonds. The present industrial pollution abatement program is criticized for lack of an effluent standard. Seven proposals are submitted to correct industrial pollution. In two subparts, motor vehicular and stationary source pollution, the President proposes corrective measures with respect to air pollution. In a discussion of solid waste management President Nixon proposes programs for re-use or processing of disposable containers and junk autos. More efficient use of federal land for parks and public recreation is recommended. A final section suggests methods for implementing environmental improvement proposals. (Hart-Florida)

MARINE POLLUTION PROBLEMS AND REMEDIES,
Oscar Schachter, and Daniel Serwer.
American Journal of International Law, Vol 65, No 1, p 84-111 (1971). 28 p, 83 ref.

Descriptors: *International waters, *Water pollution control, *Water pollution sources, *International law, Water pollution, Pollution abatement, Water pollution effects, Aquatic environment, Oil, Oily waters, Chlorinated hydrocarbon pesticides, Coasts, Ships, Waste disposal, Pollutants, Sea water, Treaties, International commissions, Administrative agencies, United Nations, Foreign countries, Governments, Remedies, Legal aspects.

Marine pollution is a global problem of great magnitude. No single measure or type of measure on either the national or international level is adequate to meet the range of marine pollution problems. Marine pollution control measures must be tailored carefully to fit particular problems. A summary is made of what is known about pollution sources, the extent to which they are found in the marine environment, how they affect the marine environment, what international controls now apply, and the prospects for future pollution and its control. Four specific marine pollution problems and their remedies are discussed. These include pollution caused by oil, chlorinated hydrocarbons, wastes discharged from coasts, and wastes dumped from vessels. The international machinery used to deal with these problems has not been effective. Comprehensive international conferences on the problems are needed, along with a greater recognition of the need for regional pollution control organs. A large part of the solution also lies in making old institutions more effective and maintaining the needed pressure from scientists, professional groups, and the public at large. (Smiljanich-Florida)
W71-07717

NATIONAL WATER QUALITY STANDARDS ACT OF 1971 (A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT).
Senate Bill 523, 92d Cong, 1st Sess Feb 2, 1971. 48 p.

Descriptors: *Water quality control, *Water pollution, *Water pollution control, *Legislation, Water quality, Federal government, State governments, Local governments, Coordination, Waste treatment, Treatment facilities, Water policy, Standards, Regulation, Sewage, Water pollution sources, Costs, Cost sharing, Grants, Government finance, Public rights, Environment, Environmental effects, Bodies of water, Administrative agencies.
Identifiers: *National Water Quality Standards Act of 1971, *Federal Water Pollution Control Act.

Amending the Federal Water Pollution Control Act, the proposed National Water Quality Standards Act of 1971 seeks to: (1) establish water quality standards and provide for their revision, (2) provide federal assistance to state and local governments for construction of waste treatment facilities, (3) provide improved assistance to state and interstate water pollution control agencies in the area of water pollution control and water quality enhancement, (4) improve water quality enforcement measures, and (5) assure public participation in federal programs relating to the quality of the nation's waters. The Act would authorize the Administrator of the Environmental Protection Agency to make grants to state and interstate agencies for water quality and pollution control programs and assist in various aspects of their implementation. Subsections cover procedural requirements, discretion of the Administrator, and funding of programs. The Administrator is authorized to make grants for the construction of waste treatment works. Subsections govern the implementation of this provision. The Act calls for formulation and implementation of water quality control and enhancement programs. Factors to be considered and procedures to be followed in approving and coordinating such plans are outlined. Federal enforcement procedures include both civil and criminal penalties for violation of various portions of the Act. (Duss-Florida)
W71-07718

SANTA BARBARA CHANNEL MORATORIUM AND ECOLOGICAL PRESERVE ACT (A BILL TO PROVIDE FOR A FEDERAL ECOLOGICAL PRESERVE IN A PORTION OF THE OUTER CONTINENTAL SHELF).

Senate Bill 373, 92d Cong, 1st Sess, Jan 27, 1971. 9 p.

Descriptors: *Leases, *Oil, *Channels, *Water pollution sources, Pollution abatement, Oil fields, Water quality control, Federal government, Legislation, Coasts, Shores, Drilling, Beds under water, Pacific Ocean, Ownership of beds, Gases, Mineralogy, Wildlife management, Oil industry, Oil reservoirs, Oil wells, Oily water, Offshore platforms, Exploitation, Legal aspects, Navigation.

In response to recent events concerning the Santa Barbara Channel oil spill, the Santa Barbara Channel Moratorium and Ecological Preserve Act would regulate future oil production and create a federal ecological reserve in the area. Present drilling and production methods constitute an environmental and navigational hazard and a threat to Santa Barbara and its submerged lands sanctuary. The Act would terminate certain leases in the channel with just compensation from appropriations provided herein. The areas in which the leases are terminated would become a federal ecological preserve, which would not be subject to drilling for or production of oil, gas or other minerals. Drilling on certain other leases would be suspended until the Secretary of the Interior insures that future oil spillage can be prevented, ecological hazards can be minimized, and underwater production techniques have been perfected and will be used so that no apparatus is visible above the surface of the water or creates a navigational hazard. Three leases would be allowed to continue operating until oil spillage and leaks in the channel have been minimized. (Smiljanich-Florida)
W71-07719

WATER RIGHTS ACT OF 1971 (A BILL TO CLARIFY THE RELATIONSHIP OF INTERESTS OF THE UNITED STATES AND OF THE STATES IN THE USE OF THE WATERS OF CERTAIN STREAMS).
Senate Bill 28, 92d Cong, 1st Sess, Jan 25, 1971. 5 p.

Descriptors: *Federal-state water rights conflicts, *Reservation doctrine, *Compensation, *Legislation, Water resources development, Regulation, Federal government, State governments, Governments, Federal jurisdiction, State jurisdiction, Water rights, Legal aspects, Administration, Condemnation value, Prior appropriation, Riparian rights, Competing uses, Prescriptive rights, Water sources, Water utilization, Water resources, Water supply.

Under this proposed legislation the withdrawal or reservation of surveyed or unsurveyed lands of the United States would not affect any right to the use of navigable or non-navigable water acquired pursuant to state law either before or after the establishment of such withdrawal. In the latter case a federal statute or a promulgation by an appropriate officer of the United States of the purpose, quantity, and priority date of the water right reserved to the United States would defeat rights under state law. No right to diversion, storage, distribution, or use of water which the United States asserts to have been established under the laws of a state shall be greater or less than those accorded by the laws of that state to other users. No vested water rights shall be taken or used by the United States without just compensation. If works of the United States interfere with any vested compensable water rights, the United States shall initiate eminent domain proceedings. If this is not done, no statute of limitations shall apply against a suit by an injured party for compensation. (Robinson-Florida)
W71-07720

A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT TO PROTECT THE NAVIGABLE WATERS OF THE UNITED STATES FROM FURTHER POLLUTION BY REQUIRING THAT PESTICIDES COMPLY WITH CERTAIN STANDARDS OF BIODEGRADABILITY AND TOXICITY.
Senate Bill 281, 92d Cong, 1st Sess, Jan 26, 1971. 3 p.

Descriptors: *Water pollution control, *Pesticide toxicity, *Legislation, *Biodegradation, Pesticide residues, Federal government, Water quality control, Navigable waters, Pesticides, Fungicides, Herbicides, Pesticide removal, Public health, Environmental sanitation, Chemical wastes, Pollutants, Water pollution sources, Nonstructural alternatives, Water quality, Hazards, Insecticides, Legal aspects, Regulation, Administration.
Identifiers: Federal Water Pollution Control Act.

This proposed amendment to the Federal Water Pollution Control Act mandates pesticide biodegradability and toxicity standards and prohibits the manufacture or importation of substandard pesticides. Under the bill, the Secretary of the Interior would be required to prescribe standards and rules preventing non-conforming pesticide manufacture by January 1, 1973. The Secretaries of the Interior and the Treasury would be required to promulgate rules preventing the importation of such pesticides. All standards and rules promulgated under this bill would become effective July 1, 1973. Willful violation of the provisions of this bill or pursuant regulations would constitute a misdemeanor. First offenses are punishable by a fine not exceeding $500. Subsequent offenses are punishable by a fine not exceeding $2,000. As used in this bill 'pesticide' means any fungicide, herbicide, rodenticide, or insecticide. (Earl-Florida)

OF NORWOOD V SHEEN (DAMAGES SEWAGE FLOW ON PRIVATE PROPER-

E 102-107 (Ohio 1933).

riptors: *Ohio, *Eminent domain, *Sewage sal, *Damages, Sewers, Sewage, Land, Land e, Drains, Water pollution, Drainage systems, low, Surface waters, Pipes, Storm drains, ls, Cities, Waste water (Pollution), Wastes, e disposal, Compensation, Legal aspects, Judiecisions.

Plaintiff executor brought suit for damages against defendant city for appropriation of decent's property. Plaintiff alleged that defendant had taken over a private sewer during decendent's lifetime and operated it so as to flood and pollute decendent's property. Plaintiff charged that this amounted to an appropriation of the property. Defendant contended that: (1) plaintiff's action was grounded in negligence and could not be maintained in the absence of a negligence statute governing the operation of sewers; (2) there was no appropriation; and (3) the issue of damages was improperly submitted to the jury. Plaintiff recovered at the trial level. The Supreme Court of Ohio reversed on the issue of damages. Plaintiff's action was not grounded in negligence, but was based on appropriation of private property for a public use. The petition alleging that defendant used the sewer and drain facilities so as to cause flooding and pollution of property stated a good cause of action against defendant for temporary appropriation of private property for a public use. However, since the injury was not permanent, evidence regarding the value of the land was not admissible, and the trial court should have charged the jury as to what measure of damages was applicable. (Duss-Florida)

WILSON V CITY OF LAURENS (DAMAGES DUE TO NEGLIGENT CONSTRUCTION OF DRAINAGE SYSTEM).
132 SE 590-591 (SC 1926).

Descriptors: *South Carolina, *Drainage systems, *Surface drainage, *Surface runoff, Drains, Eminent domain, Damages, Compensation, Benefits, Cities, Construction, Maintenance, Floods, Diversion, Surface waters, Judicial decisions, Legal aspects.

Plaintiff landowner sought damages from defendant city for flood damages to his property due to defendant's negligent construction and maintenance of a drainage system. Plaintiff alleged that defendant altered the drainage system so that in time of flood, water was diverted onto plaintiff's property. Defendant contended that: (1) the improvements were made properly, (2) they benefited plaintiff's property, and (3) no damage to plaintiff resulted from any defect in the drainage system or anything under defendant's control. In the trial court the jury returned a verdict for plaintiff. Defendant appealed on the grounds that plaintiff should have brought his action under a statute requiring compensation for damages arising from street improvements, and that the trial judge failed to properly charge the jury concerning the benefits of the system. The Supreme Court of South Carolina affirmed. Plaintiff's cause of action was grounded in the city's failure to provide a proper system of surface drainage, and required no statutory basis. Because of plaintiff's theory of negligence, no charge regarding benefits was necessary. (Duss-Florida)

ROSE ISLAND CO V UNITED STATES (DAMAGES TO AMUSEMENT PARK BY OVERFLOW FROM DAM BACKWATER).
46 F2d 802-804 (WD Ky 1930).

Descriptors: *Dams, *Backwater, *Compensation, *Streams, Non-navigable waters, Riparian land, Riparian waters, Damages, Real property, Parks, Boating, Recreation, United States, Legal aspects, Judicial decisions.

Plaintiff riparian landowner sued for compensation when defendant United States' dam caused his land to be overflowed. A small non-navigable stream flowed through plaintiff's land into the Ohio River. Defendant's dam caused the water to rise in this stream. Plaintiff used the property as an amusement park and asserted that the increased depth of the stream lessened its attractiveness as a boating stream for the park. The Federal District Court held that defendant must compensate plaintiff for any injury caused by the dam. However, the lessening of the stream's attractiveness for boating was held too conjectural and uncertain to permit recovery. Recovery was allowed for injury to plaintiff's parking lot and for narrow strips of plaintiff's property along the creek which were permanently submerged. (Hart-Florida)

DALCHE V BOARD OF COMM'RS OF ORLEANS LEVEE BD (CONSTITUTIONALITY OF TAKING RIPARIAN LAND FOR RESIDENTIAL PROPERTY).
49 F2d 374-385 (ED La 1931).

Descriptors: *Lakes, *Eminent domain, *Flood control, *Marshes, Condemnation, Real property, Riparian land, Riparian waters, Compensation, Payment, Legislation, State governments, Cities, Legal aspects, Judicial decisions, Louisiana.
Identifiers: *Constitutionality.

Plaintiff landowner sought to enjoin defendant board of commissioners from condemning his riparian land. Plaintiff contended that the proposed taking was for a private purpose in violation of the 14th amendment. Defendant planned to erect a sea wall along plaintiff's property and to reclaim a portion of lake bottom and marshlands. The area thus taken was to be converted into a residential section. Thirty per cent of the property was to be dedicated for a public amusement park. The project would eliminate flooding of New Orleans and alleviate mosquito proliferation. The Federal District Court held that a proper public purpose was performed by the project and rejected plaintiff's contention. Plaintiff's suit was dismissed, the court noting that a right of action for compensation existed. (Hart-Florida)
W71-07748

UNITED STATES V KINCAID (INJUNCTION TO PREVENT FLOOD CONTROL PROJECT PROCEEDING UNTIL LAND TO BE OVERFLOWED HAS BEEN ACQUIRED).

49 F2d 768-769 (5th Cir 1931).

Descriptors: *Mississippi River, *Flood control, *Flooding, *Eminent domain, Condemnation, Real property, Riparian land, Riparian waters, Administrative agencies, Compensation, Remedies, Legal aspects, Judicial decisions, Federal government, United States.

Plaintiff riparian landowner sought to enjoin defendant United States from proceeding with a flood control project which would subject plaintiff's land to more severe flooding. The land had not been acquired for flooding either by purchase or condemnation. The Fifth Circuit Court of Appeals granted an injunction until defendant had acquired the property or flowage rights thereon. (Hart-Florida)
W71-07749

UNITED STATES V BOYNTON (BOUNDARY OF RIPARIAN LAND WHICH HAD BEEN MEANDERED).
53 F2d 297-298 (9th Cir 1931).

Descriptors: *Accretion (Legal aspects), *Boundary disputes, *Meanders, *Land tenure, Real property, Boundaries (Property), Riparian land, Riparian waters, United States, High water mark, Tides, Legal aspects, Judicial decisions, Surveys.

Plaintiff United States brought action to quiet title to accretions to riparian land on an Indian reservation. The land had been surveyed by the United States for allotment to individual members of the tribe. The surveyor meandered along the water. Plaintiff contended that the boundary of the tract was the high water mark; defendant asserted that the boundary was fixed by the survey. To prove its

contention, plaintiff endeavored to show that the survey had merely meandered along the water line to designate the high water mark generally. Meander lines were defined as referring to the water line itself, subject to tides and water levels. The United States Court of Appeals determined that meander lines were not normally fixed boundaries; hence, the court concluded that the conveyance must expressly provide that the meander was a fixed boundary to alter that rule. Since the conveyance was silent on the matter, the court held that the high water mark, rather than the meander, was the boundary of the tract. (Hart-Florida)

LIPSCOMB V GIALOURAKIS (TERRITORIAL BOUNDARIES OF GULF STATES).
133 So 104-107 (Fla 1931).

Descriptors: *Florida, *Gulf of Mexico, *Boundary disputes, *Jurisdiction, Gulfs, Legal aspects, Judicial decisions, State governments, Governments, Legislation, Bodies of water, Local governments, Fishing, Commerical fishing, State jurisdiction.

Defendants were tried for using illegal methods to catch sponges and for taking sponges below the minimum size in the Gulf of Mexico. The state appealed a judgment by the Circuit Court of Taylor County discharging the accused. Defendants contended that the indictment showed on its face that the offense was not committed within the jurisdiction of Taylor County. The Supreme Court of Florida reversed the judgment and held that the indictment sufficiently charged that a statutory offense had been committed within the jurisdiction of Taylor County. All the bottoms of the gulfs and natural bays within the limits of the State of Florida passed to the State of Florida when Florida was admitted to the Union. The counties bordering on the Gulf of Mexico include that area within the Gulf adjacent to the upland and extending to the state boundary line. (Robinson-Florida)

CITY OF BIRMINGHAM V FLOWERS (DAMAGES RESULTING FROM IMPROPER CULVERT).
140 So 353-356 (Ala 1932).

Descriptors: *Alabama, *Controlled drainage, *Culverts, *Flood damage, Legislation, Judicial decisions, Drainage, Surface drainage, Drains, Engineering structures, Structures, Channels, Conduits, Local governments, Governments, Damages, Flood control, Floods, Water injury, Legal aspects.

Plaintiff landowner sued defendant city for damages to property caused by an overflow of water from a culvert. Defendant alleged as error the refusal of the following charges to the jury: (1) the jury could not award any damages to plaintiff for negligent construction of the culvert, since the complaint asserted only negligence in maintenance, and (2) the failure of plaintiff to report the overflow within a reasonable time defeated his right to recover. Defendant also challenged an instruction stating that, if a reasonable man should have known that the culvert was insufficient, defendant should be held liable for damages. The trial court rendered judgment for plaintiff, and the Supreme Court of Alabama affirmed. The complaint charging defendant with maintaining a permanent, inadequate culvert stated a single cause of action for permanent damage. If the drainage system itself was proper, and the damage resulted from inadequate maintenance, each recurring injury created a separate cause of action. The measure of damages for permanent injury was properly the difference in value of the land before and after the overflows, present and prospective. The complaint was not defective in failing to assert negligence in construction, since negligent construction also constitutes negligent maintenance. (Robinson-Florida)

MARTIN V GRAVITY DRAINAGE DIST NO 14 (ENLARGING GOV'T DRAINAGE DITCHES ON PRIVATE LAND).
143 So 93-95 (La Ct App 1932).

Descriptors: *Louisiana, *Ditches, *Drainage districts, *Controlled drainage, Legislation, Judicial decisions, Legal aspects, Governments, State governments, Local governments, Damages, Drainage systems, Drainage engineering, Drainage programs, Drainage, Drainage water, Drainage practices, Water control, Channeling, Channels, Canals, Land tenure, Real property, Eminent domain, Remedies.

Plaintiff landowner sued defendant drainage district for damages ensuing when defendant widened and deepened an old drainage ditch on plaintiff's property and piled the excavated dirt on plaintiff's land. Plaintiff contended that he had lost 2.18 acres of land. Defendant alleged that the ditch was not made any deeper or wider than was necessary and the the spoil dirt had to be piled on plaintiff's land. Defendant further argued that plaintiff was estopped from bringing the action by his silence at the time of the work and that the benefits exceeded the damages. Defendant also alleged that it had control over 100 feet on each side of the ditch under a Louisiana statute. The trial court dismissed the complaint. The Louisiana Court of Appeal affirmed, stating that plaintiff had not proven the extent of his damages. The court held that the statute giving the drainage district control of 100 feet on both sides of the ditch did not deprive landowners of the right to recover the value of the land taken. The fact that benefits exceed damages is no defense, since a plaintiff is assumed to pay for these benefits by payment of taxes. (Robinson-Florida)

CITY OF VICKSBURG V PORTERFIELD (CITY'S RESPONSIBILITY TO MAINTAIN DRAINS FREE OF OBSTRUCTION).
145 So 355-357 (Miss 1933).

Descriptors: *Mississippi, *Floods, *Flood damage, *Storm drains, Land tenure, Land use, Legal aspects, Public rights, Judicial decisions, Local governments, Governments, Drainage, Drainage water, Drainage engineering, Controlled drainage, Drains, Culverts, Sewers, Flood control, Overflow, Storm runoff, Water injury, Water control.

Defendant city allowed a drain pipe to become clogged so that during a hard rain the water rose and flooded the property of plaintiff. Plaintiff sought damages. Defendant contended that the rain was excessive and that it was not bound to provide for unusual and excessive rainfall. Defendant further contended that it had acquired a prescriptive right to allow continuance of the condition without liability. Defendant maintained that an instruction of the lower court stating that when the city built the embankment and drain the law imposed a duty upon the city to keep said drain open and free from obstruction was error. The Supreme Court of Mississippi affirmed a decision for the plaintiff. A city maintaining a public street is under a duty to keep the drains under the fill in proper condition, whether or not the city constructed the fill and drain. A city must provide for such floods as may reasonable be expected, judging from such as have previously occurred, but is not liable for damages which could not have been provided for or guarded against. In the instant case the rain causing injury was not unprecedented and could have been guarded against. (Robinson-Florida)

OPERATION AND MAINTENANCE OF FLOOD PROTECTION WORKS.
Corps of Engineers, Washington, D.C.

33 Code of Federal Regulations, Sec 208.10 (1970). 5 p.

Descriptors: *Operation and maintenance, *Flood protection, *Flood control, *Regulation, Administrative agencies, Administration, Federal government, State governments, Local governments, Construction, Levees, Engineering structures, Channels, Pumping plants, Floodways, Inspection, Hydrologic data, Drainage, Drainage systems, Rivers, Flow control, Dams, Reservoirs, Benefits, Costs, Legal aspects.

In order to obtain maximum benefits from local flood protection works constructed by the United States, this federal regulation prescribes general and specific methods of operation and maintenance of such structures and facilities. Specific structures covered include: (1) levees, (2) flood walls, (3) drainage structures, (4) closure structures, (5) pumping plants, and (6) channels and floodways. Generally, any state or local agency responsible for the operation and maintenance of flood control works shall appoint a committee headed by a 'superintendent' who shall be responsible for the project during flood periods and for continuous inspection and maintenance during periods of low water--all without cost to the United States. The regulation also prescribes the procedures to be followed in constructing further improvements within project areas. Reports shall be submitted by the superintendent to the district engineer covering inspection, maintenance, and operation of protective works. For the maintenance of specific structures, the regulations require frequent inspections and prescribe specific times when inspections should be made. Measures for maintaining the various structures are enumerated. In order to assure proper functioning and minimize damages, operation of project structures requires continuous patrol during flood periods. A final section of the regulation covers miscellaneous facilities. (Duss-Florida)

PORT WARDENS V MARYLAND CAPITAL YACHT CLUB (ADMINISTRATIVE DETERMINATION OF IMPAIRMENT OF NAVIGATION IN RIVER).
273 A2d 102-109 (Ct App Md 1971).

Descriptors: *Maryland, *Boat-launching ramps, *Port authorities, *Administrative decisions, Boats, Navigation, Administrative agencies, Local governments, Permits, Regulation, Legal aspects, Construction, Engineering structures, Riparian rights, Rivers, Bulkheads, Piers, Docks, Breakwaters, Dredging, Channel improvement, Environment engineering, Judicial decisions.

Plaintiff yacht club sought declaratory relief from defendant port warden's denial of permission to build boat slips and related structures and to conduct dredge and fill operations in a river. Plaintiff also sought to have the mayor and aldermen's affirmation of the denial declared void. Plaintiff contended that the port wardens could not deny a permit unless they found that navigation would be impaired. Plaintiff also contended that the mayor and aldermen were limited to reviewing the record of the hearing and could not conduct a hearing de novo. Defendant contended that the construction of all of the proposed slips would render navigation too close and confined. The Court of Appeals of Maryland affirmed the trial court's granting of the relief sought and reviewed the evidence in the case. The testimony of witnesses at the port warden's hearing clearly indicated that plaintiff's proposed operation would not interfere substantially with navigation. A court may overturn an agency's finding of fact where that finding is deemed to be arbitrary, unreasonable, and capricious. Although additional evidence may have been introduced at the mayor and aldermen's hearing, they had no authority to conduct a de novo hearing. (Smiljanich-Florida)
W71-07987

BOWLEY V OMAHA AIRPORT AUTHORITY (CONDEMNATION VALUE OF LANDS SUBJECT TO FLOODS).
182 NW2d 911-915 (Neb 1971).

Descriptors: *Nebraska, *Condemnation value, *Floodways, *Land appraisal, Eminent domain, Condemnation, Flood proofing, Flood plain zoning, Levees, Flood protection, Water districts, Flood plains, Missouri River, Channels, Flood control, Land use, Compensation, Industries, Recreation, Rivers, State governments, Administrative agencies, Judicial decisions, Legal aspects, Floods.

Plaintiff landowner sought by eminent domain proceedings to appraise the value of land to be condemned by defendant agency. Plaintiff contended that the land was suitable for industrial purposes and that, although the land was situated in the flood channel of the Missouri River, a levee could be constructed to prevent floods. Plaintiff also contended that he could force the creation of a levee district to construct such a levee. Defendant contended that the land was suitable only for recreational use and sand mining. In affirming a verdict and judgment for defendant's requested valuation, the Supreme Court of Nebraska noted that the land was vulnerable to floods, had poor access to river traffic, and was not in an industrial area. Moreover, evidence was insufficient to show that a new levee would adequately protect plaintiff's land from floods. As to the creation of a levee district, it appeared that many landowners might be affected by such a levee. In addition to the approval of the county board, it would be necessary to obtain a permit under the Flood Plain Act. (Smiljanich-Florida)
W71-07988

DURSO V STATE (CONDEMNATION OF PORTION OF LANDOWNER'S SEWAGE SYSTEM).
318 NYS2d 791-793 (App Div 1971).

Descriptors: *New York, *Cesspools, *Condemnation value, *Damages, Eminent domain, Condemnation, Land tenure, Sewage treatment, Sewage disposal, Waste treatment, Domestic wastes, Leaching, Gravity, Sewers, Boundaries (Property), State governments, Damages, Highway relocation, Judicial decisions, Legal aspects.

Action was brought by plaintiff restaurant owner to recover damages for appropriation of land by defendant state. Plaintiff contended that the condemnation of land by the state included portions of his gravity-type sewage system and that an allowance of $600 damage by the lower court was inadequate. Defendant contended that only one cesspool of plaintiff's sewage system was appropriated and that the damages awarded were reasonable. In modifying the judgment of the Court of Claims, the Supreme Court of New York, Appellate Division, Third Department, noted that the taking of the condemned land removed one of plaintiff's cesspools and cut across the tile leach lines which led to a substantial dispersal area. Plaintiff's gravity-type sewage system was thus rendered useless. Plaintiff was not entitled to damages for installation of a complicated and sophisticated sewage system, however, but was awarded $5000 in damages to replace the previous sewer system. (Smiljanich-Florida)
W71-07989

ACT REQUIRING BONDS AS SECURITY FOR DAMAGE TO PUBLIC LANDS BY DRILLING AND MINING.
Florida Laws, ch 69-367, p 1293 (1969).

Descriptors: *Florida, *Public lands, *Drilling, *Mining, State jurisdiction, Damages, Legislation, Oil industry, Mineral industry, Leases, Oil, Gases, Sulfur, Air pollution, Water pollution, Wildlife conservation, Marine animals, Public health, Legal aspects, Administrative decisions, Administrative agencies.

The Trustees of the Internal Improvement Trust Fund shall require a surety or property bond from lessees intending to drill or mine on public lands. The bond shall serve as security and is to be forfeited to the Trustees to pay for any damages caused by the mining or drilling operations. If the drilling or mining will be conducted in the waters of the state, the Trustees shall give special consideration to the extent of such possible damages, including air and water pollution, and destruction of wildlife or marine productivity. (Smiljanich-Florida)

TITLE TO SUBMERGED LANDS AND RESTRICTIONS ON BULKHEAD LINES AND FILLING AND DREDGING.

Florida Laws, Ch 69-308, amending Fla Stat Sec 253.12 (1), p 1112 (1969).

Descriptors: *Florida, *State jurisdiction, *Dredging, *Ownership of beds, Beds under water, Land tenure, Islands, Sand bars, Banks, Federal government, Landfills, Coasts, Navigable waters, Lakes, Navigable rivers, Streams, Bulkhead line, Permits, Administrative agencies, Legislation, Legal aspects.

The Trustees of the Internal Improvement Trust Fund are vested with title to all sovereignty submerged lands, including: (1) all islands, sand bars, shallow banks and small islands made by the dredging of any channel by the United States government; (2) sand bars and shallow banks located in the navigable waters; (3) all coastal and intracoastal waters of the state; and (4) all submerged lands owned by the state by right of its sovereignty in navigable freshwater lakes, rivers and streams, except submerged lands conveyed by prior deed or statute. Submerged land in navigable freshwater lakes, rivers and streams are hereby included within restrictions relating to bulkhead lines and filling and dredging of submerged lands. (Smiljanich-Florida)

LOUISIANA SOUTHERN RY V BOARD OF LEVEE COMM'RS (LIABILITY OF STATE FOR FLOODING OF LANDS BY LEVEE).
176 La 687, 146 So 470-472 (1933).

Descriptors: *Louisiana, *Levees, *Flooding, *Damages, Flood damage, Submergence, Floodwater, State jurisdiction, Flood control, Compensation, Net income, Profit, Land use, Government finance, Legislation, Judicial decisions, Legal aspects, Administrative decisions, Remedies.

Plaintiff railway sued defendant board of levee commissioners for loss of revenue due to flooding of plaintiff's lands. The flooding was caused by an artificial break in defendant's levee. Plaintiff contended that defendant had assumed liability for the intentional act and therefore should pay for los plaintiff's revenue while its lands were covered w water. Defendant contended that the stat authorizing payment of damages limited s damages to the injury to physical property. In firming a dismissal of the suit by the lower co the Supreme Court of Louisiana noted that state has the right of determining the propriety, cation, and mode of building levees. Whate damages are caused to others in the exercise of right are non-compensable without voluntary sumption of liability. Defendant had accepted bility limited to physical damages, and plaintiff therefore not allowed to recover for consequer injuries. (Smiljanich-Florida)
W71-08054

PALMER CORPORATION V COLLINS (C TAMINATION OF OIL BY WATER SEEPA FROM NEGLIGENTLY ABANDONED WELL).
214 Ky 838, 284 SW 95-98 (1926).

Descriptors: *Kentucky, *Oil wells, *Groundw *Seepage, Drill holes, Oily water, Groundw movement, Oil-water interfaces, Impervious Groundwater barriers, Infiltration, Oil, Oil r voirs, Drilling equipment, Leases, Damages, tenure, Judicial decisions, Legislation, aspects.

Plaintiff leaseholder sued defendant corpor for damages caused by defendant's failur adequately plug up abandoned oil wells. Pla contended that the abandoned wells allowed to seep into the oil-bearing stratum, thus taminating plaintiff's oil with water. Defen contended that plaintiff had not sufficiently pr that the water came from defendant's aband wells. Defendant also contended that a st authorizing plaintiff to go on defendant's lan plug up the wells and then maintain an a against defendant to recover the cost preclude plaintiff from additionally seeking damages oil. The Court of Appeals of Kentucky, in affi the lower court judgment for plaintiff, noted water had not appeared in plaintiff's oil until d dant's wells were abandoned and subsequ found to contain water. The statute autho plaintiff to prevent future damages did preclude his right to recover for the past inju curred by the water. To destroy the producti oil is to destroy property, allowing the own recover damages thereby sustained. (Smilja Florida)
W71-08055

GIBSON V MADDEN (BOUNDARY DIS REGARDING MEANDER OF STREAM ADVERSE POSSESSION).
229 Ky 273, 17 SW2d 263-266 (1929).

Descriptors: *Kentucky, *Boundary disputes eanders, *Prescriptive rights, Boundaries (P ty), Streams, Riparian lands, Land tenure, W courses (Legal), Riparian rights, Banks, Ju decisions, Remedies, Thalweg, Channels, aspects.
Identifiers: *Adverse possession.

Plaintiff brought action against defendant to title to a disputed strip of land. Plaintiff cont that a boundary line described in a deed as drawn 'up the creek' meant that the bounda followed the center of the creek with its mea Plaintiff alternatively contended that he h tained title to the land through adverse poss Defendant contended that the disputed bou line was meant to be a straight line not fol the thread of the stream and that he had plaintiff permission to use the land in questio precluding adverse possession. The Court peals of Kentucky, affirming a judgment for dant, noted that the context of the deed in that a straight line was the true boundary property. The defendant, therefore, had titl land and had given his permission for plai

he land. No prescriptive title to a contested of land is established through use where such is with the owner's permission. (Smiljanich-da)

THRUP V CITY OF JACKSON (ABATE-T OF MUNICIPAL WASTE POLLUTION DAMAGES).
Mich 20, 262 NW 641-644 (1935).

riptors: *Michigan, *Municipal wastes, ter pollution, *Remedies, Rivers, Cities, rian land, Riparian rights, Reasonable use, ages, Sewage disposal, Waste dumps, Sewage ment, Pollution abatement, Treatment facili-Water pollution effects, Relative rights, rian waters, Local governments, Legislation, ial decisions, Legal aspects.
ifiers: *Nuisance.

tiff riparian landowner sued defendant city ng damages and an injunction. Plaintiff con-d that defendant's raw sewage was emptied river bounding plaintiff's land, thus polluting ver and creating a nuisance. Plaintiff also con-d that defendant's sewage system was not a rnmental function but was a private or rictary function. Defendant contended that a sion in the city charter required plaintiff to nt his claim to the city as a prior condition to ing suit, which the plaintiff had failed to do. In ning the injunction granted by the lower court reversing an award for past damages, the me Court of Michigan held that the charter sion requiring prior presentment of claims to ity was valid as applied to damages incidental atement of a nuisance. The court noted that a ge system is a necessary city function which is c in character and therefore a governmental ise protected by charter provisions. (Smil-h-Florida)

TE EX REL BUCKSON V PENNSYLVANIA DETERMINATIONS BY PRIOR SURVEYS OCATION OF MEAN LOW WATERLINE).

A2d 268-271 (Del 1971).

Descriptors: *Delaware, *Low water mark, *Boundaries (Property), *Landfills, Water level fluctuations, Riparian rights, Delaware River, Boundary disputes, Geological surveys, State governments, Railroads, Core drilling, Rivers, Banks, Water levels, Average, Measurement, Variability, Riparian land, Judicial decisions, Legal aspects, High water mark.

Plaintiff attorney general sought a declaratory judgment to determine title and related rights to certain foreshore between high and low water marks on a river. Plaintiff contended that defendant's filling operation extended beyond the mean low waterline. Plaintiff also contended that surveys made in 1942 and 1954 as to location of the mean low waterline were adequate in determining its location in 1964, when the filling operation was commenced. Plaintiff alternatively requested that the case be remanded to permit the state to make geological examinations of core drillings in order to establish the natural mean low waterline. Defendant contended that surveys made in 1967, after the filling operation ceased, were the only adequate evidence as to the location of the mean low waterline. In affirming the lower court judgment for defendant, the Supreme Court of Delaware noted that the surveys taken in 1942 and 1954 were inadequate to accurately demarcate the mean low waterline of 1964. The state's request for a new determination, made five years after the commencement of the action, was not timely and therefore rejected. The survey of 1967 was the only adequate evidence as to the waterline's location. (Smiljanich-Florida)

NEW RIVERS AND OLD REALITIES: WHY WESTERNERS DISAGREE ABOUT SHARING THEIR WATER WEALTH,
Department of Environment, Ottawa (Ontario). Prairie Region Water Planning.
Frank J. Quinn.
Arizona Review, Vol 20, No 4, Apr 1971. 9 p.

Descriptors: *Inter-basin transfers, *Arid lands, *Planning, *Beneficial use, Environmental effects, Evaluation, Political aspects, Legal aspects, Social aspects, Water resources development, Surface waters, Rivers, Canada, Southwest U.S., Pacific Northwest U.S.

This is a discussion of manipulation of water resources for interbasin transfer. The Southwest contends with an imbalance between growing population and dwindling water resources. Obvious solutions such as reallocation of existing water rights to guarantee beneficial use and recycling require complicated political maneuvering which is often unsuccessful. In fact, no man-made water diversions now cross major political boundaries. In the past, surplus parts of a basin have supplemented deficit parts of the same basin. Water is different from other resources, often coming free with property, and is allocated by differing state governments. One user may affect many other users. Some current thoughts on interbasin transfer follow: Water transfers on a large scale of necessity would create large-scale environmental disturbances. Efficiency based arguments state that water should go to the highest bidder, or where it is most valuable. Equitable-sharing proponents use the amount of so-called 'progress' or social benefits gained, to evaluate systems of water use. Environmental thinkers advocate comprehensive planning and thorough preliminary studies before interbasin transfer is to be attempted. The problem must be viewed as a national, rather than a regional struggle. (Yensen-Arizona)

RIVER BASIN MONETARY AUTHORIZATION AND MISCELLANEOUS CIVIL WORKS AMENDMENTS ACT OF 1970.
Public Law No 91-282, 84 Stat 310, 6 US Code Cong and Admin News, p 1837-1840 (1970). 4 p.

Descriptors: *River basin development, *Government finance, *Project planning, *Projects, Legislation, River basins, Flood control, Planning, Water resources development, Financing, Budgeting, Allotments, Federal government, Water supply, Water storage, Water management (Applied), National parks, Dams, Hydroelectric plants, Reservoirs, Water rights, Pumped storage, Barriers, Fish hatcheries, Legal aspects.

Pursuant to previous acts authorizing various public water projects, Congress herein authorizes additional appropriations for prosecution of these projects. The projects so affected include: various comprehensive river basin plans; and the central and southern Florida comprehensive plan for flood control, including water supply requirements for the Everglades National Park. Congress also modifies various other public water projects to include: (1) the construction of local protection works in a flood control project in Ohio; (2) authorization to include the construction of a pumped storage development in the comprehensive development plan of the Delaware River Basin; (3) the construction, operation, and maintenance of fish hatchery facilities in Montana; and (4) authorization for a city to construct a barrier dam across a lake in Texas, provided that the city obtain any necessary state water rights. (Smiljanich-Florida)

INTERNATIONAL, NATIONAL AND STATE ELEMENTS OF OCEANS AND COASTAL ZONE MANAGEMENT,
California Advisory Commission on Marine and Coastal Resources.
Robert B. Brueger.
Oceans 71 Conference, Mar 11, 1971, Long Beach, California. 17 p.

Descriptors: *Oceans, *Water management, *Water policy, *Water resources development, *Legislation, International waters, International law, Coasts, Seas, Regulation, Planning, Political aspects, State governments, Federal government, California.
Identifiers: Global oceans management.

Oceans management is a global issue, with state, national and international policies having global effects. Five essential guidelines for a global oceans management system are presented, with emphasis on concomitant political realism. International progress is being made, as demonstrated by the establishment of the U.N. Seabeds Committee, a 1973 U.N. Conference on ocean issues, and a 1972 U.N. Conference on the Human Environment. U.S. federal regulation and policy development for ocean management is explored with references to the River and Harbors Act of 1899, the Refuse Act of 1899, the 1953 Outer Continental Shelf Lands Act, the National Environmental Policy Act of 1969, and the proposed National Coastal and Estuarine Zone Management Act of 1971. Lack of state regulation and policy of coastal uses is discussed. The development of the California coastal zone management system is presented in detail, with a discussion of several conservation acts and commissions, and emphasis on the proposed establishment of a state-wide coastline regulatory scheme. (McEntyre-PAI)

AN ACT PROVIDING A SETBACK LINE FOR COASTAL CONSTRUCTION AND EXCAVATION; THE GRANTING OF VARIANCES, AND PENALTIES.

Florida Laws, Ch 70-231, p 674-677 (1970) amending Fla Stat Ch 161.

Descriptors: *Florida, *Beach erosion, *Erosion control, *Coastal structures, Non-structural alternatives, Legislation, Legal aspects, Coastal engineering, Excavations, Sea walls, Shore protection, Specifications, Supervisory control (Power), Constraints, Adoption of practices, Real property,

Riparian land, Beaches, Administration, Administrative decisions, State governments, Construction, Administrative agencies, Washouts.

No person, firm, corporation, or public agency shall construct any dwelling, hotel, motel, apartment, sea wall, revetment, or incidental or related structures within fifty feet of the mean high water line of riparian coastal locations. This amendment to existing legislation encompasses the Gulf of Mexico and Atlantic shorelines exclusive of bays, inlets, rivers, bayous, creeks, and passes. Setback waiver or variance may be authorized by the Department of Natural Resources: (1) upon facts clearly justifying waiver on variance; (2) if existing structures have established a reasonably continuous, closer construction line not affected by erosion; and (3) for the construction of non-eroding pipelines and piers. Structures or excavations violating this section are hereby declared a public nuisance. The Department of Natural Resources may remove such nuisance after failure to comply with written notice. All costs shall constitute a lien upon the property. Each month of violation shall constitute a separate offense punishable by not less than $500, nor more than $1000. This section shall not apply to existing structures, structures under construction, or shore protection structures. The Department may specifically exempt coastline areas not subject to substantial erosion. (Earl-Florida)
W71-08174

INTERNAL IMPROVEMENT TRUST FUND (TRUSTEES GIVEN POWER OF EMINENT DOMAIN OVER SUBMERGED LANDS).
Florida Laws Ch 70-358, p 1139 (1970) amending Fla Stat Sec 253.02. 1 p.

Descriptors: *Florida, *Eminent domain, *Beds under water, *Administrative agencies, Beds, Legislation, Condemnation, Land, Land tenure, Navigable waters, Legal aspects.

Amending portions of existing Florida statutes relating to the Board of Trustees of the Internal Improvement Trust Fund, this act provides the Board with the power of eminent domain over submerged lands. Certain lands are excluded from this power. The Board shall be a necessary party in eminent domain proceedings involving submerged lands and lands under navigable waters. (Duss-Florida)
W71-08177

AN ACT RELATING TO THE BOARD OF TRUSTEES OF THE INTERNAL IMPROVEMENT FUND, PROHIBITING THE ISSUANCE OF AFTER-THE-FACT CONSTRUCTION PERMITS.
Florida Laws ch 70-116, p 429-430 (1970) amending Fla Stat sec 253.124.

Descriptors: *Florida, *Administrative decisions, *Permits, *Landfills, Land development, Land use, Administration, Adoption of practices, Administrative agencies, Environmental effects, Conservation, Real property, Supervisory control (Power), Environment, Constraints, Legislation, Legal aspects, Marine plants, Coastal engineering, State governments.

The Board of Trustees of the Florida Internal Improvement Fund shall in no case issue after-the-fact construction permits for the filling of land. Upon consideration of a report by the Department of Natural Resources, however, such a permit may be granted where the Board finds that any other remedy available to it would be more damaging to the environment or marine resources. The granting of such permits shall not absolve applicants from the provisions of subsection five of this section. (Early-Florida)
W71-08200

INTERNAL IMPROVEMENT TRUST FUND (AMENDMENT TO LAW RELATING TO DREDGING AND FILLING).
Florida Laws ch 70-167, p 540-542 (1970) amending Fla Stat sec 253.123. 3 p.

Descriptors: *Florida, *Dredging, *Navigable waters, *Bulkheads, Legislation, Pumping, Navigation, Channels, Beach erosion, Sands, Administrative agencies, Administration, Landfills, Legal aspects, Beaches, Shores.
Identifiers: *Bulkhead lines.

Amending existing Florida statutes relating to restrictions on filling land and dredging beyond bulkhead lines, this act provides two things. First, it extends existing restrictions on the removal of material from certain navigable waters to apply to waters landward as well as channelward of bulkhead lines. Secondly, the act eliminates an exception to the general prohibition against removal of sand, rock or earth from navigable waters by dredging, pumping, digging or other means. Specifically, no longer will such removal be permitted for the replenishment of eroded beaches or for the prevention or reduction of beach erosion. (Duss-Florida)
W71-08201

INTERNAL IMPROVEMENT TRUST FUND (PERMITS RELATING TO THE FILLING OF LAND).

Florida Laws Ch 70-333, p 973-974 (1970) amending Fla Stat Sec 253.124.

Descriptors: *Florida, *Permits, *Coastal structures, *Riparian land, Navigable waters, Bulkheads, Sea walls, Shore protection, Retaining walls, Erosion, Avulsion, Administrative agencies, Administration, Legislation, High water mark, Construction, Ecology.

Amending an existing Florida statute relating to the filling of land, this act requires riparian upland owners bordering navigable waters to obtain a permit before rebuilding, replacing, repairing or reconstructing certain coastal structures. Coastal structures covered include seawalls, retaining walls, revetments, bulkheads or other similar structures. Permits shall be issued by the authorized local or county body. Permits are subject to the approval of the Board of Trustees of the Internal Improvement Trust Fund and are not valid without approval. The Act outlines circumstances under which riparian owners may be exempt from submitting biological and ecological studies concerning the effects of their proposed work. (Duss-Florida)
W71-08202

FLORIDA AIR AND WATER POLLUTION CONTROL ACT (ASSESSMENT OF DAMAGES TO FISH POPULATIONS).
Florida Laws Ch 70-141, p 488 (1970) amending Fla Stat Sec 403.141.

Descriptors: *Florida, *Water pollution control, *Damages, *Fishkill, Water pollution, Conservation, Fish, Administrative agencies, Regulation, Wastes, Fish populations, Legislation, Ecology, Aquatic environment, Administration, Standards.

Amending an existing Florida statute relating to assessment of damages against polluters whose discharges into waters damage fish populations, this act provides that a table of values for individual categories of fish shall be utilized in assessing such damages. The Department of Air and Water Pollution Control shall promulgate such table of values and shall utilize existing values established by the Department of Natural Resources and the Game and Fresh Water Fish Commission. (Duss-Florida)

THE REFUSE ACT OF 1899: NEW TASKS FO AN OLD LAW,
William C. Steffin.
Hastings Law Journal, Vol 22, No 3, p 782-80 (1971). 23 p, 156 ref.

Descriptors: *Rivers and Harbors Act, *Water po lution control, *Pollution abatement, *Was disposal, Legislation, Non-structural alternative Permits, Judicial decisions, Federal governmen Federal jurisdiction, Water quality control, Wat pollution, Water pollution sources, Effluents, I dustrial wastes, Administration, Legal aspect Navigable waters, Administrative agencies, Supe visory control (Power), Regulation, Adjudicati procedure.

Known as the Refuse Act, Section 13 of the Rive and Harbors Act of 1899 prohibits the discharge refuse into navigable waters without a permit. Th note considers utilization of the Refuse Act a water pollution control device. Contempora abatement devices, because of restrictive judici doctrines or ineffective statutory enforceme procedures, are inadequate. In the author's vie the Refuse Act overcomes a number of existi abatement barriers. Broad judicial interpretati and the Act's recently implemented discharge-pe mit system make it applicable to most water poll tion violations. Enforcement procedures under t Act are detailed. The Justice Departmen reluctance to exercise its enforcement authority analyzed and critized. Injunctive relief and crimin sanctions are available under the Act. The pos bility of extending injunctive relief to futu discharges and the removal of past discharges discussed. The nature and utilization of qui tam a tions is examined. The effectiveness of enforc ment procedures on a class of pollutors is co sidered in terms of specific case histories. T author concludes that the Act is a valuable poll tion control tool which could become more valu ble with an effectively administered permit syste (Earl-Florida)
W71-08228

THE LEGAL STATUS OF ARTICLES 1-3 THE CONTINENTAL SHELF CONVENTIO ACCORDING TO THE NORTH SEA CASES,
Myron Nordquist.
California Western International Law Journal, V 1, No 1, p 60-79 (1970). 20 p, 81 ref.

Descriptors: *International law, *Continen Shelf, *Beds under water, *Regime, United N tions, Judicial decisions, Treaties, Internatio waters, Boundary disputes, Legal aspects, Jurisd tion, International commissions, Foreign countri Law of the sea, Beds, Political aspects, Exploi tion, Administration.

As interpreted in the North Sea Continental Sh Cases, the status of Articles 1-3 of the Continen Shelf Convention is evaluated in this article and lated to present attempts to regulate internatio sea-bed areas. The principles and rules of law forth in the North Sea Cases are reviewed by author. Although the customary law status of A cles 1-3 were not ruled upon in the North S Cases, the author scrutinizes both the majority a dissenting opinions for indications of that stat After focusing particular attention upon Arti One, the author concludes that Articles 1-3 wo be integral components of any Continental Sh regime. The view that these articles are custom law is supported by state practice patterned af these articles. If Articles 1-3 are in fact custom law, their effect upon newly negotiated treat must be carefully weighed. Rights obtained un

xploitation clause of Article One would con-
with the Draft Convention on the International
Bed Area submitted by the United States. For-
tely, no perfected exploitation claims exist,
there is still time to rationally develop a sea-
regime. Accelerated technological advances,
ever, indicate the time for rational develop-
may be running out. (Earl-Florida)

f 1970.

substance, common-law roots, and potential
ioning of the Michigan Environmental Protec-
Act are examined in this note. The Act ex-
ly recognizes and expands a legal interest in
onmental protection, enforceable through
or private litigation. A procedural framework
ablished for the assertion of this right in judi-
roceedings. The author evaluates the Act in
of: (1) the legal basis for the environmental
afforded, (2) review of administrative
edings., (3) the Act's lack of judicial stan-
, (4) the variety of actions and remedies
ble under the Act, and (5) the protection af-
d indigents. Constitutional questions arising
the Act are examined. The direct judicial con-
ation of environmental issues allowed by the
removal of barriers to private environmental
ns are evaluated. Implicit recognition that en-
mental protection requires a balancing of
eting interests is contained in the Act's
y of enforcement actions. The absence of
tary awards may be only partially cured by
rovision authorizing class actions. Although a
d alternative to prior legislative and adminis-
e remedies is provided, the Act's flexibility
s its potential effectiveness difficult to pre-
Early cases must be well defined to insure the
ly development of judicial standards. (Earl-

UENT CHARGES: WATER POLLUTION
TROL,
nna M. Longo.
al of Law Reform, Vol 4, No 1, p 47-62
). 16 p, 67 ref.

riptors: *Water pollution control, *Water
y control, *Economic justification, *Cost al-
on, Effluents, Real costs, Total costs, Water
, State governments, Federal government,
governments, Legislation, Non-structural al-
tives, Pollution abatement, Water pollution,
onmental sanitation, Administration, Ad-
trative agencies, Judicial decisions, Legal
ts, Water users, Economics, Feasibility stu-
Resource allocation, Waste disposal.
fiers: *Water Quality Act of 1965, Effluent-
e systems.

gnizing the gravity of the national water-pollu-
roblem, this note examines the necessity and
tutionality of effluent charge systems. In the
r's view, water pollution exists because water
underpriced commodity. Under an effluent-
e system the total cost of each unit of water,
ling pollution costs, are assigned to each user.
r quality standards promulgated under the
r Quality Act of 1965 have failed to encom-
he total-cost concept. Institutional arrange-
ments for administration effluent charges are compared at the federal, state, and local level. In the author's view, practical and political problems dictate that effluent systems be administered at the state level. The constitutionality of state-administered effluent charges are analyzed in relation to: (1) prohibitions against special commissions, (2) municipal home rule provisions, and (3) indebtedness limitations. To successfully implement an effluent-charge system, the author concludes that each state should adopt legislation: (1) vesting in the state ownership or control of all public water resource facilities; (2) establishing an agency with comprehensive water planning, development, and management authority; and (3) allowing actions by private attorneys general against such an agency. (Earl-Florida)
W71-08231

THERMAL POLLUTION: THE ELECTRICAL UTILITY INDUSTRY AND SECTION 21 (b) OF THE FEDERAL WATER POLLUTION CONTROL ACT,
Russell L. Johnson.
Hastings Law Journal, Vol 22, No 3, p 685-704 (1971). 20 p, 160 ref.

Descriptors: *Thermal pollution, *Electric power industry, *Water quality control, *Water pollution control, Federal government, Legislation, Legal aspects, Judicial decision, Pollution sources, Electric powerplants, Thermal water, Water pollution, Nuclear powerplants, Pollution abatement, Temperature, Environmental effects, Administration, Adoption of practices, Administrative agencies, Administrative decisions, State governments, Cooling waters, Thermal conductivity, Ecology, Supervisory control (Power).
Identifiers: *Federal Water Pollution Control Act, *Water Quality Improvement Act of 1970.

The Water Quality Improvement Act of 1970 (WQIA) was enacted to control thermal pollution by electric utilities. Evaluated in this note is the Act's impact in relation to the environmental problems created by thermal pollution. Water quality standards and enforcement procedures under the Federal Water Pollution Control Act (FWPCA) have not adequately protected the aquatic environment from nuclear and fossil fuel generating plants. A case study is utilized by the author to demonstrate that the FWPCA does not allow preventative regulation of thermal pollution. Section 21 (b) of the WQIA was intended to fill this regulatory gap. The act requires certification to the appropriate federal agency that existing water quality standards will not be violated. WQIA certification procedures, compliance checks, and licensing agency jurisdiction are evaluated. The substantive weaknesses of Section 21 (b) are evaluated. Such weaknesses include: (1) the absence of public hearings, (2) inadequate regulation of fossil-fuel plants, and (3) the inadequacy of related water quality standards. Despite such weaknesses the WQIA is a major step in the preventative control of thermal pollution. (Earl-Florida)
W71-08232

THE NORTH SEA CONTINENTAL SHELF CASES--A RAY OF HOPE FOR THE INTERNATIONAL COURT,
L. F. E. Goldie.
New York Law Forum, Vol 16, No 2, p 325-377 (1970). 53 p, 189 ref.

Descriptors: *International law, *Continental Shelf, *Judicial decisions, *International commissions, Boundary disputes, Boundaries (Property), United Nations, Jurisdiction, Foreign countries, Foreign waters, Beds under water, Regime, Regulation, Administration, Treaties, Political aspects, Law of the sea, International waters, Oil industry, Legal aspects, Exploitation.

The North Sea Continental Shelf Cases are evaluated in this article in relation to their effect upon the role of the International Court of Justice. The Court's holding in these cases, based in part upon the Continental Shelf Convention and in part upon an international 'duty to negotiate' over lapping continental shelves, is examined in terms of: (1) the facts of the dispute, (2) arguments presented, (3) equity and distributive justice principles, and (4) the 'natural prolongation doctrine' and equidistance principle. The author relates customary international law on the Continental Shelf to: (1) the formation and formative organs of international law, (2) proposed principles of international common law, and (3) the court's view of the customary law status of the Continental Shelf Doctrine. The source, significance, and development of the international obligation to bargain in good faith are considered, along with objections thereto. Alternative Continental Shelf regimes are discussed in light of: (1) goals, (2) areas, (3) participants, and (4) measures. The agent state model administrative conciliation, and multi-national public enterprises are considered as alternative regimes. The author concludes that the North Sea decision may afford a means of restoring the court to a central position in the international legal order. (Earl-Florida)

A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT TO CHANGE THE TREATMENT WORKS CONSTRUCTION PROGRAM.
Senate Bill 1092, 89th Cong, 1st Sess (1965).

Descriptors: *Water pollution treatment, *Treatment facilities, *Construction costs, *Grants, Allotments, Financing, Projects, Administration, Project planning, Water pollution control, Pollution abatement, Water quality control, Cost allocation, Administrative agencies, Government finance, Federal government, Human population, Urbanization, Cities, State governments, Legislation, Legal aspects.

Provisions of the Federal Water Pollution Control Act regarding treatment works construction programs would be amended by this bill to delineate the limitations on federal grants and to allot federal sums appropriated pursuant to the Act. No federal grant would be made for any project under the Act unless such project shall have been approved by the appropriate state water pollution control agency and by the Secretary, and unless such project is included in a comprehensive program developed pursuant to the Act. Such grants would not exceed 30 per centum of the estimated reasonable cost of the treatment works. The projects must be in conformity with the state water pollution control plan and must satisfactorily assure proper and efficient operation and maintenance of the treatment works. Sums appropriated pursuant to the Act would be allotted both on the basis of the total state population and on the basis of the state urban population. Any state failing to use allocated funds for lack of projects would, subject to certain restrictions, have those funds reallocated to other states. (Smiljanich-Florida)
W71-08234

MARINE EXPLORATION AND DEVELOPMENT ACT.
Senate Bill 1091, 89th Cong, 1st Sess (1965).

Descriptors: *Continental Shelf, *Water resources development, *Exploitation, *Exploration, Mining engineering, Oceans, Water resources, Marine geology, Beds, International waters, International law, Treaties, Federal jurisdiction, Coasts, Environmental engineering, Surveys, Mapping, Financing, Grants, Loans, Institutions, Industries, Federal government, Administrative agencies, Legislation, Legal aspects.

The Marine Exploration and Development Act would provide a program of marine exploration and development of the resources of the Continental Shelf. The United States would assume responsibility for programs of exploration and development of the resources, pursuant to rights obtained under

the Convention on the Continental Shelf, through encouragement of private investment and dissemination of information. A Marine Exploration and Development Commission would be established. The Commission would formulate and carry out programs for purposes of exploration and development of the marine resources of the Continental Shelf and its waters, including programs for expeditions, surveys, and development of an engineering capability for exploitation of the marine resources. The Commission would be authorized to enter into agreements with other government agencies and with public or private scientific institutions or enterprises for the carrying out of activities authorized by this Act. A Marine Exploration and Development Fund would be established to provide loans or grants authorized by this Act to public or private scientific institutions or business enterprises. Provisions for monetary appropriations and dissemination of information would also be made under the Act. (Smiljanich-Florida)

CONSERVATION DIRECTORY 1971.
National Wildlife Foundation.

The National Wildlife Foundation, Wash, DC (1970). 152 p, 2 append.

Descriptors: *Administrative agencies, *Organizations, *Institutions, *Conservation, Natural resources, Professional societies, Technical societies, Personnel, Management, Leadership, Occupations, Classification, Publications, Information retrieval, Universities, History, Engineering personnel, Professional personnel, Scientific personnel, Water resources, Administration, Federal government, State governments, Local governments, Legal aspects.
Identifiers: *Directories.

Agencies, committees, organizations and officials concerned with natural resource use and management are listed in this directory, including relevant information such as their general purposes and organization, and the addresses, phone numbers and names of their officials. Among the organizations listed are: (1) congressional committees; (2) federal executive departments; (3) federal independent agencies; (4) international, national and interstate governmental commissions; (5) international, national and interstate private organizations; (6) state and territorial governmental agencies and private citizens groups, listed by state and territory; and (7) Canadian provincial territorial agencies and citizens groups. A list of major colleges and universities offering professional training for a career in natural resources management and a listing of fish and game commissioners and directors of the United States and Canada are appended, along with a list of periodicals of interest. WATER FOR WESTSTATE, USA: THE ASSOCIATION IN THE POLITICS OF WATER RESOURCE DEVELOPMENT,
Eddie B. Eiselein.
Dept of Anthropology, Univ of Arizona (1969). 271 p, 27 fig, 18 tab, 136 ref, 1 append.

Descriptors: *Water resources development, *Decision making, *Political aspects, *Organizations, Southwest US, Institutions, Conservation, Social aspects, Water policy, Water resources, Institutional constraints, State government, Local governments, Recreation, Cooperation, Interstate, Personnel, Leadership, Legal aspects, Water management (Applied).
Identifiers: *Associations.

Water resources development in the American West is partially dependent upon a political process of decision-making. This political process is viewed by this dissertation as a system composed of various social units, and it is examined through the activities of one type of social unit--the formal voluntary association. Eight associations were studied over a period of eighteen months. Each of the associations was examined with regard to its structure and activities in water resource development, including: (1) the internal organization of the association, (2) the relationship of the association with the water-oriented power structure of the state, (3) the interrelationships with the other social units of the system, (4) the problems of associational success and failure, and (5) function of the association in the internal maintenance of the system and its output. The associations were found to decrease the potential for cooperation in many respects, yet did provide an informal and non-public setting for compromise and decision-making. The interdependency of the associations is discussed, along with the distribution of power throughout the system, particularly between the public and private sectors. (Smiljanich-Florida)

TEMPORARY CLOSURE OF WATERWAYS TO NAVIGATION; REMOVAL OF WRECKS AND OTHER OBSTRUCTIONS.
Corps of Engineers, Washington, D.C.

33 Code of Federal Regulations, Secs 209.180, 209.190 (1970). 4 p.

Descriptors: *Navigation, *Navigable waters, *Rivers and Harbors Act, *Federal jurisdiction, Navigable rivers, Accidents, Hazards, Safety, Adoption of practices, Administration, Administrative agencies, Federal government, Supervisory control (Power), Channel improvement, Canals, Harbors, Ships, Legislation, Legal aspects, Judicial decisions, Administrative decisions, Construction, Channels.
Identifiers: Administrative regulations.

Herein promulgated by the Secretary of the Army are procedures applicable to the closing of, or removal of obstructions from, navigable waterways. Factors to be evaluated in authorizing the temporary closing of a navigable waterway include: effects on navigation, times and duration of the closing, and necessity. Where no question as to necessity or propriety exists, the District Engineer may inform an applicant that the Department of the Army will not object for a stated period of time. All other cases will be forewarded to the Chief of Engineers. Section 8 of the Rivers and Harbors Act of 1890, sections 15, 19, and 20 of the Rivers and Harbors Act of 1899, and an act of September 17, 1965, govern the removal of wrecks and obstructions. Government removal, absent formal abandonment, involves the taking of private property. Removal is not generally undertaken unless an obstruction influences general navigation. Procedures are detailed for: (1) reporting accidents affecting navigation, (2) informing the Coast Guard, (3) requesting removal authority and funds, and (4) the marking of obstructions. Legal guidelines relating to removal authority and the establishment of owner abandonment are also provided. (Earl-Florida)

KEY LARGO CORAL REEF PRESERVE.
Department of the Interior, Washington, D.C.

Code of Federal Regulations, Title 43, Subtitle A, part 15 (1970). 3 p.

Descriptors: *Reefs, *Supervisory control (Power), *Preservation, *Florida, Federal jurisdiction, Boating regulations, Water pollution control, State governments, Fishing, Dredging, Coordination, Federal government, Marine geology, Shoals, Regulation, Adoption of practices, Integrated control measures, Non-structural alternatives, Administrative agencies, Administrative practices, Administration, Legal aspects, Legislation, Wildlife conservation, Natural resources.

The Department of the Interior herein sets forth regulations governing the operation of the key Largo Coral Reef Preserve. It is the policy of the Department to cooperate with the State of Florida in preserving the reef. The removal or destruction of natural reef features or marine life is forbidden. No dredging excavating, or filling operations are permitted in the Preserve. The dumping or depositing of refuse or polluting substances is prohibited. No person shall willfully destroy, molest, or tamper with any wrecks or cargoes thereof within the Preserve. The removal or defacing of Preserve signs and monuments is forbidden. Spear fishing or the use of poisons, electric charges, or other such fishing methods is prohibited. Skin diving for observation or pleasure is encouraged. The collection of scientific specimens shall be allowed only under written permit. No watercraft shall be operated so as to strike or damage natural features. The use or possession of explosives or dangerous weapons within the Preserve is forbidden. The Preserve may be closed to the public in the event of emergencies. Accidents shall be promptly reported. All federal acts and Florida laws and regulations shall be enforced. (Earl-Florida)

OPEN BEACHES ACT OF 1971 (A BILL DECLARING A PUBLIC INTEREST IN THE OPEN BEACHES OF THE NATION).

Senate Bill 631, 92nd Cong, 1st Sess (1971). 9 p.

Descriptors: *Beaches, *Public rights, *Public benefits, *Condemnation, Recreation, Public lands, Legal aspects, Land tenure, National seashores, Federal government, State governments, Federal jurisdiction, State jurisdiction, Compensation, Condemnation value, Easements, Eminent domain, Legislation.

Under this proposed legislation the public shall have a free and unrestricted right to use the beaches of the United States to the full extent that such public right may be extended consistent with the constitutional property rights of littoral landowners. No person shall construct or maintain an obstruction which interferes with the right of the public to enter, lease, cross or use the public beaches. The United States district courts may adjudicate actions: (1) to establish and protect the public right to the beaches, (2) to determine the existing status of title, and (3) to condemn such easements as are necessary to accomplish the purposes of this bill. Certain evidentiary rules are set out by this bill. This bill does not interfere with the authority of the states to act for the public benefit. Interests in land recovered under authority of this bill shall be subject to state ownership, and the states must provide at least 25% of the cost of condemnation. The federal government and the states shall act in joint partnership to accomplish the purposes of this bill. Definitions of relevant terms are provided. (Robinson-Florida)
W71-08246

NATIONAL MARINE WATERS POLLUTION CONTROL AND QUALITY ENHANCEMENT ACT OF 1971 (A BILL TO AMEND THE FEDERAL WATER POLLUTION CONTROL ACT).
Senate Bill 1011, 92d Cong, 1st Sess (1971). 10 p.

Descriptors: *Waste dumps, *Coasts, *Waste disposal, *Water pollution control, Pollution abatement, Sewage disposal, Ultimate disposal, Oceans, Continental Shelf, Sea water, Shores, Waste treatment, Coastal structures, Offshore platforms, Ships, Water pollution sources, Water pollution, Treatment facilities, Standards, Regulation, Administrative agencies, Federal government, State governments, Legislation, Legal aspects.
Identifiers: *Contiguous zone.

Entitled the National Marine Waters Pollution Control and Quality Enhancement Act of 1971, this proposed amendment to the Water Pollution Control Act would provide means and measures to control the discharge of wastes into the waters of the contiguous zone and the sea. No persons could discharge wastes into the waters of the contiguous zone from any vessel, except sewage discharged from marine sanitation devices, or from any onshore or offshore facility. No wastes could be discharged into waters beyond the contiguous zone unless permitted by the Environmental Protection Agency pursuant to regulations promulgated in this Act. Civil penalties for violations are provided, along with procedures for enforcement. The Environmental Protection Agency would be given authority to issue regulations governing the discharge of wastes in waters beyond the contiguous zone by establishing quantities, times, locations, circumstances, and conditions of such discharges. Limitations on the regulations are set forth, along with provisions for research and grants for the construction of treatment works. (Smiljanich-Florida)

BUREAU OF LAND MANAGEMENT PROGRAM POLICY--ENVIRONMENTAL CONSIDERATIONS.
Bureau of Land Management, Washington, D.C.

Federal Register, Vol 36, No 65, Saturday, Apr 3, 1971, p 6422-6423.

Descriptors: *Land management, *Environmental effects, *Public lands, *Adoption of practices,

Land resources, Water resources, Natural resources, Land development, Conservation, Land use, Water management (Applied), Water resources development, Project purposes, Long-term planning, Federal government, Administrative agencies, Legislation, Administration, Coordination, Regulation, Industrial production, Social needs, Ecology, Legal aspects, Programs.

Pursuant to the National Environmental Policy Act and an executive order, the Secretary of the Interior herein amends regulations relating to the Bureau of Land Management. Interested parties submitted suggestions which are incorporated into the revised regulations. Environmental considerations in land management shall include: (1) the attainment of the widest range of beneficial uses of the environment without undue environment degradation or risk to health or safety; (2) the attainment of optimum production of land products consistent with acceptable environmental quality; and (3) the preservation of historic, cultural and natural aspects of the national heritage. Matters to be considered are: (1) existing or future economic and social needs; (2) effect on other resource values; (3) inter-agency coordination and cooperation; (4) consistency with national programs; (5) compatibility of possible uses; and (6) compatibility with long-term productivity and environmental integrity. THE ROLE OF THE COURT IN PROTECTING THE ENVIRONMENT--A JURISPRUDENTIAL ANALYSIS,
Manton M. Grier.
South Carolina Law Review, Vol 23, No 1, p 93-113, 1971. 21 p, 80 ref.

Descriptors: *Resource allocation, *Decision making, *Judicial decisions, *Institutions, Adjudication procedure, Pollution abatement, Environment, Water allocation (Policy), Resource development, Water resources development, Institutional constraints, Governments, Legislation, Water pollution, Water pollution control, Water quality, Water distribution (Applied), Political aspects, Social aspects, Social values, Water policy, Legal aspects.

Protection for the environment is increasingly being sought through the courts. An examination is made in this article of the proper role that a court as an institution should play in protecting the environment. When courts are asked to solve environmental problems, questions arise as to whether they are institutionally suited to solve the problems and whether the courts have the constitutional power to consider the problem. The end result of adjudication is the formal declaration of rights and wrongs. Adjudication is therefore not a proper form of deciding how the community should allocate its scarce resources. Questions involving such discretion should be left to the legislature. The polycentric features of resource allocation, wherein there are many interacting centers of influence, also suggest that courts should play a more limited role in trying to solve the environmental crisis. The constitutional aspects of the institutional limits of adjudication are 'standing' and 'political questions'. The court's role as an institution should be to enforce the basic requirements of social living by enjoining forms and levels of pollution that constitute a threat to the continued existence of society. ENVIRONMENTAL LAW--NUISANCE--INJUNCTIVE RELIEF DENIED IN PRIVATE ACTION FOR NUISANCE CAUSED BY INDUSTRIAL POLLUTER.
New York University Law Review, Vol 45, p 919-927, 1970. 45 ref.

Descriptors: *Air pollution, *Pollution abatement, *Remedies, *New York, Legal aspects, Judicial decisions, Environment, Environmental effects, Legislation, Pollutants, Air pollution effects, Damages, Public health, Water pollution, Water pollution control.
Identifiers: *Injunctions.

Considering the availability of injunctive relief in New York in private actions for pollution abatement, this article discusses the decision in Boomer v. Atlantic Cement Co, 26 N.Y. 2d 219, 257 N.E.2d 870, 309 N.Y.S.2d 312 (1970). In Boomer plaintiffs sought to restrain defendant cement plant from emitting dust and raw materials and conducting blasting operations to the detriment of plaintiff's property. In the ultimate decision the Court of Appeals of New York granted plaintiffs a temporary injunction, to be vacated upon the payment of permanent damages by defendant. The majority found this to be the most equitable and practicable remedy, compensating plaintiffs and avoiding closing defendant's plant. The effect of the decision was to apply a new balancing test in New York; an injunction should not be granted when the harm to the defendant in granting it is greater than to the plaintiff in denying it. The central argument of the majority is that private actions are not the most practical method for effective control of polluters, that is, questions of pollution control should be decided by the legislature and not by private lawsuits. This article disagrees with the Boomer decision. The decision unnecessarily inhibits the rights of individuals, appears to contravene the actual intent of the legislature, and does not provide adequate incentive for defendants to abate pollution. RIPARIAN RIGHTS.
In: Adkins, JC, Florida Real Estate Law and Procedure, Harrison Company, Atlanta, p 1611-1628 1960. 52 ref.

Descriptors: *Riparian rights, *High water mark, *Riparian land, *Florida, Navigable waters, Artificial use, State governments, Legislation, Legal aspects, Natural use, Navigation, Ownership of beds, Relative rights, Remedies, Riparian waters, Usufructuary right, Water pollution, Boating, Fishing, Land tenure, Real property, Accretion (Legal aspects), Docks.

The nature of riparian rights are considered in the first section of this article. Riparian rights are defined, and limitations upon riparian rights are set forth. The relationship between riparian rights and conveyances of riparian land is discussed. The second section defines the limits of riparian land ownership. Holdings of Florida courts are analyzed with respect to definitions of: (1) ordinary high water mark, (2) ordinary high tide, and (3) shore. Rules promulgated by Florida courts for determining the location of the high water mark are considered. The common law right to erect wharves or piers for access to navigable waters, with the consent of the sovereign, is primarily considered in the third section. An invasion of the sovereign's property right or 'purpresture' is discussed. The remaining sections consider the remedy available for special injury to riparian rights and the severability of riparian rights from the land. (Hart-Florida)

AN ACT RELATING TO THE PUBLIC AND ENVIRONMENTAL HEALTH AMENDING THE FLORIDA AIR AND WATER POLLUTION CONTROL ACT BY PROVIDING ADDITIONAL GROUNDS FOR INJUCTIVE RELIEF.
Florida Laws, Ch 70-139, p 486 (1970), amending Fla Stat Sec 403.131.

Descriptors: *Florida, *Water pollution control, *Pollution abatement, *Remedies, Air pollution, Administration, Administrative decisions, Adoption of practices, State governments, Administrative agencies, Environment, Environmental sanitation, Supervisory control (Power), Adjudication procedure, Legislation, Legal aspects, Environmental effects.
Identifiers: Injunction (Prohibitory), Injunction (Mandatory).

The Florida Air and Water Pollution Control Act is hereby amended to provide additional grounds for injunctive relief proceedings. Upon a finding that a generalized air or water pollution condition has created an emergency requiring immediate action to prevent harm to property or animal, plant, or aquatic life, injunctive relief shall be sought. (Earl-Florida)
W71-08258

AN ACT RELATING TO THE DEPARTMENT OF AIR AND WATER POLLUTION CONTROL: ENFORCEMENT PROCEDURE FOR TEMPORARY AND NON-CONTINUING VIOLATIONS.

Florida Laws, Ch 70-114, p 425-426 (1970) amending Fla Stat Sec 403.121.

Descriptors: *Florida, *Pollution abatement, *Remedies, *Administrative decisions, Water pollution control, Air pollution, Legislation, Legal aspects, Administration, Administrative agencies, Supervisory control (Power), Constraints, State governments, Local governments, State jurisdiction, Pollutants, Pollutant identification, Water quality control.

The alternative enforcement procedures provided the Florida Department of Air and Water Pollution Control, in this amendment to existing legislation, shall not apply to municipalities or political subdivisions. Upon reason to believe that a temporary or non-continuing violation of this act has occurred, the director of the Department or his delagatee may issue a citation ordering corrective action. Citable violations include, but are not limited to: (1) spills of polluting substances, (2) open burning, and (3) sudden discharges of pollutants. No administrative hearing shall be required. Citations shall state the date of the corrective action's commencement and completion. Cases in which such dates are not met may be referred to the prosecuting attorney. When warnings would best serve the public interest, the director shall not be required to report minor violations. Citations are appealable and may be suspended pending a departmental hearing. It shall be the duty of prosecuting attorneys to investigate and, when warranted, prosecute reported violations. Violations of this subsection shall be a misdemeanor. (Earl-Florida)
W71-08259

NICHOLS V VILLAGE OF MORRISTOWN (LIABILITY OF CITY FOR BACKWATER FLOODS DUE TO CONSTRUCTION OF CULVERTS).
257 NW 82-83 (Minn 1934).

Descriptors: *Minnesota, *Obstruction to flow, *Culverts, *Floods, Alteration of flow, Natural flow doctrine, Riparian rights, Streamflow, Backwater, Overflow, Rain, Streams, Riparian land, Relative rights, Ditches, Bridges, Local governments, Cities, Judicial decisions, Legal aspects.

Plaintiff landowner sued defendant seeking to enjoin the obstruction of a watercourse and to compel the city to remove a culvert and install a bridge in its place. Plaintiff also claimed damages for past inundations of his property. Plaintiff contended that in replacing a bridge across a stream with a tile culvert and ditch, defendant had interfered with the natural flow of the watercourse and had caused plaintiff's lands to flood. Defendant contended that plaintiff's lands were naturally subject to occasional floods due to a backup of water from a river into the stream tributary. In affirming a lower court judgment for defendant, the Supreme Court of Minnesota noted that plaintiff's lands had been subject to floods before the bridge was replaced by a culvert. The city had provided an adequate outlet for the flood waters. The outlet was reasonably sufficient for such rains as might be anticipated. Defendant had therefore not substantially interfered with the natural flow of the watercourse. (Smiljanich-Florida)

THE CROSS-FLORIDA BARGE CANAL: A LESSON IN ECOLOGY,
Suzy Fisher.
Civil Engineering, Vol 41, No 4, p 44-48, Apr 1971. 5 p, 2 fig.

Descriptors: *Canal construction, *Ecology, *Environmental effects, *Florida, Canals, Governments, Fish conservation, Wildlife conservation, Water pollution, Algae, Surface waters.
Identifiers: *Environmental protection.

President Nixon's decision to halt construction of the Cross-Florida Barge Canal last January climaxed an extended battle between conservationists and the U. S. Army Crops of Engineers. After the Corps began construction in 1964, unfavorable reports trickled in from Interior Department agencies. The Bureau of Sport Fisheries and Wildlife said canal development would harm animals living in the region. Later, the Federal Water Pollution Control Administration predicted that dense algal blooms would develop in canal impoundments, restricting uses of these waters. Florida's Game and Fresh Water Fish Commission added that canal construction would impair sport fishing. Others charged the benefit/cost ratio set for the project was unrealistic. Conservation groups organized to fight the canal in the late Sixties. This experience indicates that in the future, large-scale development projects will go hand-in-hand with environmental safeguards, and those who neglect environmental standards will find their projects in trouble. DATA ERROR EFFECTS IN UNIT HYDROGRAPH DERIVATION (Discussion),
Krishan P. Singh.
J Hydraulics Div, Am Soc Civil Engrs, Vol 96, No HY7, p 1633-1636, Jul 1970. 1 tab, 2 ref.

Descriptors: *Unit hydrographs, *Methodology.
Identifiers: *Error analysis, *Data analysis.

The author comments upon the analysis of the errors of the first three of the four methods of unit hydrograph derivation studied in the original paper: (1) Laguerre Functions Method (LFM); (2) Harmonic Series Method (HSM); (3) Least Square Method (LSM); and (4) Gamma Distribution Method (GDM); when the basic data (the hyetograph and hydrograph) were in error. The mean errors, as a percentage, for the four methods of derivation using error-free data are presented in a table. Errors due to functional structure and flexibility of the methods are demonstrated. Further investigation is suggested concerning the fact that the derived unit hydrographs will differ more from the true ones for smaller durations of rainfall excess and errors in data. COMPUTER DETERMINATION OF THE GEOMETRY AND TOPOLOGY OF STREAM NETWORKS,
Purdue Univ., Lafayette, Ind. Dept. of Geosciences; and Toronto Univ. (Ontario). Dept. of Civil Engineering.
D. M. Coffman, and A. K. Turner.
Water Resources Research, Vol 7, No 2, p 419-423, Apr 1971. 5 p, 2 fig, 2 tab, 7 ref. OWRR Project A-007-IND (1).

Descriptors: *Drainage patterns (Geologic), *Geomorphology, *Topography, *Terrain analysis, Watersheds (Basins), Networks, Mathematical studies, Drainage systems, Channel morphology.
Identifiers: *Topology, *Stream networks.

Binary string descriptions of stream networks provide only topologic information. Applied geomorphic and engineering studies of drainage basins require network geometry as well as topology. An extension of binary string methods of data collection permits both stream classification and computation of geometric parameters. Two years' experience demonstrates the ability of this single data collection operation to provide all the information necessary for a complete analysis of real stream networks. (Knapp-USGS)

A PROPOSED STREAMFLOW DATA PROGRAM FOR SOUTH CAROLINA,
Geological Survey, Columbia, S. C.
Jeffrey T. Armbruster.
Geological Survey Open-file Report, 1970. 30 p, 1 fig, 2 plate, 8 tab, 8 ref.

Descriptors: *Streamflow, *Network design, *Data collections, *South Carolina, Planning, Stream gages, Hydrologic data, Regression analysis, Gaging stations, Natural flow, Regulated flow, Peak discharge.
Identifiers: Streamflow characteristics, Data evaluation.

An evaluation of the available streamflow data in South Carolina was made to provide guidelines for planning future surface-water data programs. The basic elements in the evaluation procedure were (1) establishment of objectives and goals of the program, (2) examination and analysis of all available data to determine which goals have already been met, (3) consideration of alternate meth of meeting the remaining goals, and (4) identif tion of elements that should be included in the ture program. Four categories of data that form framework of program design are current-purp data, planning and design data, data to define l term trends, and stream environment data. An curacy goal for planning and design data o equivalent of 10 years of record was specified minor streams. Many of the goals can be me generalizing data for gaged basins by regres analysis. Appropriate changes could be made ir present data program based on this fact. A Stre flow data program based on the guide developed in this study is proposed. (Wood USGS)

RANDOM-WALK MODEL OF STREAM WORK DEVELOPMENT,
IBM Watson Research Center, Yorktown He N.Y.
J. S. Dmart, and V. L. Moruzyi.
Available from the National Technical Inform Service as AD-717 370, $3.00 in paper copy, $ in microfiche. ONR Contract No N00014-0188, Task No NR 389-155, Technical Repo 2, Oct 1970. 21 p, 5 fig, 4 tab, 16 ref.

Descriptors: *Mathematical models, *Com programs, *Streams, *Network design, G rates, Runoff, Simulation analysis.
Identifiers: *Random-walk model.

A random-walk, headward-growth model of s network development in a region of un lithology and uniform slope was proposed principal difference from previous models wa the probability of growth was made depende the area contributing runoff to the stream t this model, a decision about whether a given s segment should be allowed to grow was reach examining the area immediately upslope. To g some feeling for the range and applicability model, two particular versions, A and B, wer grammed and tested. The major diffe between the two versions was that Version A allow no growth at all at active site A while V B would allow growth to the right only. Eac sion was run 25 times for each of six dif values of vertical dimension (w) and whe horizontal dimension (L) was set at a constan two versions were selected for simplicity wi results quantitatively satisfactory and whe input data and fewer arbitrary rubs were req A major advantage was that all the importa work variables, including drainage density an let density, came naturally out of the simu processes. flected).

nometers are used to measure the shortwave
ation reflected by natural surfaces, including
cultural fields. Measurement problems may
to associated data errors. Cylindrical shades
be necessary to restrict the view of inverted
nometers if shortwave radiation is anistropi-
y reflected. Since measurements must often be
le over small plots, the instrument view angles
t also be restricted. Measurement experiments
e performed in a uniform 2 ha. alfalfa field dur-
the summer. It was found that: (1) Measuring
ected radiation, and Eppley pyranometer
ires shading above the plane of the sensor; (2)
alfalfa crop reflects shortwave solar radiation
otropically, and shades that restrict the view
e of an inverted pyranometer to less than 160
rees result in underestimates of solar radiation
e unshaded instruments result in overestimates.

Descriptors: *Analytical techniques, *Benthos,
*Ultrasonics, Measurement, Sands, Diatoms, Den-
sity, Sediments, Frequency, Sound waves.
Identifiers: Monasteriou Bay (France).

Identical samples of sandy benthos inhabited by
diatoms were dispersed ultrasonically using three
transmitters varying in power from 100 to 500 w
and in frequency from 20 to 30 kHz. Different
combinations of frequency, power, and duration of
the treatment produced dispersion of an enormous
range from about 22,000 to more than 1,000,000
cells per cu cm of sand. In part, this variation is due
to erosion of the samples, considerably greater at
low than at high frequencies. The results could also
be influenced by the shape of containers, nature
and volume of solution, and other conditions. Stan-
dardization of the method must be confined to
benthos samples of specific granulometric and
mineralogical composition. (Wilde-Wisconsin)

William R. Hemphill, George E. Stoertz, and David
A. Markle.
Proceedings 6th International Symposium on
Remote Sensing of Environment, Michigan Univer-
sity, Ann Arbor, October 13-16, 1969, Vol 1, p
565-585, 1970. 21 p, 21 fig, 30 ref.

Descriptors: *Fluorescence, *Remote sensing,
*Tracking techniques, Tracers, Fluorometry, Dye
releases, Path of pollutants, Oily water, Air pollu-
tion, Pollutant identification, Spectroscopy.
Identifiers: Fraunhofer-line discriminator.

A prototype Fraunhofer-line discriminator, suita-
ble for aircraft operation, was built and tested using
Rhodamine WT, a luminescent dye used as a tracer
in studies of current dynamics in rivers and estua-
ries. Results of tank, shipboard, and helicopter tests
show that the instrument responds to dye concen-
trations as small as 1 ppb, and suggest that a Fraun-
hofer-line discriminator should be operationally
useful in time-of-travel and dispersion studies.
Design modifications permit use of the Fraunhofer-
line discriminator in detecting natural lu-
minescence of oil seeps and spills, some water and
atmospheric pollutants, and other materials. (K-
napp-USGS)

HYDROLOGIC COMMUNICATIONS EXPERIMENT ON THE APPLICATIONS TECHNOLOGY SATELLITE (ATS-1),
Environmental Science Services Administration, Silver Spring, Md.
Allen F. Flanders, Francis V. Kohl, and Thomas W. Davis.
Proceedings 6th International Symposium on Remote Sensing of Environment, Michigan University, Ann Arbor, Oct 13-16, 1969, Vol 1, p 197-204, 1970. 8 p, 2 fig, 2 tab, 1 ref.

Descriptors: *Telemetry, *Data transmission, *Satellites (Artificial), Hydrologic data, Data collections, Monitoring, Streamflow forecasting, Data storage and retrieval.
Identifiers: Hydrologic data transmission.

In a combined ESSA/NASA experiment, hydrologic data relay and equipment configuration testing was conducted via the VHF transponder on board the geostationary NASA Applications and Technology Satellite (ATS-1). Digital river and rainfall data were transmitted from hydrologic platforms in Arkansas, California, and Oregon upon satellite relayed interrogation by the NASA Command and Data Acquisition (CDA) station at Mojave, California. The data messages, relayed through the satellite, were recorded at Mojave, and transmitted to the Weather Bureau's Office of Hydrology in Silver Spring, Md., for teleprinter readout. Costs for a system of national scope appear commensurate with conventional ground systems when incorporated as part of a satellite vehicle performing other functions. The communications equipment required for the hydrologic ground sensors is estimated to be about $5,000 per site. (Knapp-USGS)
W71-07962

APPLICATION OF COMPUTER PROCESSED MULTISPECTRAL DATA TO THE DISCRIMINATION OF LAND COLLAPSE (SINKHOLE) PRONE AREAS IN FLORIDA,
Geological Survey, Tampa, Fla.; and Michigan Univ., Ann Arbor. Infrared and Optics Lab.
A. E. Coker, R. Marshall, and N. S. Thomson.
Proceedings 6th International Symposium on Remote Sensing of Environment, Michigan University, Ann Arbor, Oct 13-16, 1969, Vol 1, p 65-77, 1970. 13 p, 6 fig, 1 tab, 9 ref. NASA Contract No R-146-09-020-011.

Descriptors: *Land subsidence, *Remote sensing, *Aerial photography, *Sinks, *Florida, Infrared radiation, Vegetation effects, Hydrogeology, Topography, Temperature, Water levels, Water level fluctuations, Subsidence, Withdrawal, Karst.
Identifiers: *Sinkhole collapse.

Near Bartow, Florida, data were collected for the purpose of studying land collapse phenomena using remote sensing techniques. The multispectral scanner system recorded 18 spectral bands ranging from 0.4 to 14.0 microns, and several types of photography were used. Because areas prone to active sink collapse often are not detectable from apparent surface expression prior to actual collapse, it was necessary to apply indirect methods to the problem of detecting the surface effects caused by water pressure decline in the areas of active sinkhole development. An experiment was conducted to collect and process data for the purpose of testing the hypothesis that areas of active sinks could be detected at the land surface from the integrated effects of water loss at depth on vegetation physiology and terrain temperature. The multispectral data were processed on an analog computer to detect moisture-stressed vegetation and surface temperatures. The results were printed on film to show the patterns of the hydrogeologic indicators. Terrain temperature patterns when compared with moisture-stressed vegetation patterns, show distinctive patterns which correlate with areas of known sinkhole activity in the Bartow area. (Knapp-USGS)
W71-07963

DIRECT DETERMINATION OF THE ELECTROMAGNETIC REFLECTION PROPERTIES OF SMOOTH BRACKISH WATER TO THE CONTINUOUS SPECTRUM FROM 10 TO THE 8TH POWER TO 4 x 10 TO THE 9TH POWER HERTZ,
Hawaii Univ., Honolulu. Water Resources Research Center.
Larry K. Lepley.
PhD Thesis in Geosciences - Geophysics, Dec 1970. 115 p, 50 fig, 46 ref. OWRR Project B-015-HI(1).

Descriptors: *Remote sensing, Brackish water, Electromagnetic waves, *Radar, *Salinity, Estuaries, *Hawaii, Springs, Roughness (Hydraulic), Waves, Geophysics, *Chlorinity.
Identifiers: Radio spectrum, Microwave spectrum, Aerial techniques, Reflectance.

A preliminary study of the electromagnetic properties of aqueous sodium chloride, computer-generated frequency dispersion curves of (1) the dielectric coefficients, (2) power reflectance, (3) brightness temperature, and (4) skin depth of water as a function of eight different normalities of sodium chloride corresponding to a salinity range from pure to ocean water, and as a function of five different temperatures from 0C to 40C to the radio frequency range from 10 to the 6th power to 3 x 10 to the 10th power Hertz were constructed. These graphs indicate that the frequency dispersion of the reflectance of radio energy in the 10 to the 6th power to 10 to the 9th power Hertz band at normal incidence to a smooth water surface is strongly influenced by the salinity of the water, and that the spectral signature could be used as a measure of water salinity as distinguished from water temperature. Reflectance spectra from 2.5 x 10 to the 9th power to 4.0 x 10 to the 9th power Hertz of fresh and sea water were obtained with a free-wave (horn antenna and pool) system and reflectance spectra of brackish and sea water from 10 to the 8th power to 2.0 x 10 to the 9th power Hertz and of fresh water from 0.8 x 10 to the 9th power to 2 x 10 to the 9th power Hertz were obtained with a coaxial waveguide system. The measured spectral signatures appear to agree with the computed reflectance of aqueous sodium chloride solutions. The theoretical and experimental results indicate that free-wave radio reflectance spectrometry from 10 to the 6th power to 10 to the 9th power Hertz is feasible for use in remote sensing of salinity of fresh and brackish water outflows onto sea water.

Hydrometeorological Service of the USS Moscow.
A. V. Dmitriev, R. M. Kogan, M. B. Nikiforov, a Sh. D. Fridman.
Nordic Hydrology, Vol 2, No 1, p 47-56, 1971. p, 2 fig, 2 tab, 5 ref.

Descriptors: *Snow surveys, *Remote sensi *Gamma rays, *Nuclear moisture meters, *Wa equivalent, Radioactivity techniques, Surve Data collections, Instrumentation, Aircraft, Sno packs, Snow cover, Calibrations.
Identifiers: Snow mapping.

The physical basis for and the various methods measuring the water equivalent of the snow co by means of gamma-rays survey from aircraft discussed. The gamma radiation from natu radionuclides in the soil does not vary with t and by measuring the absorption of this radiat by the snow cover the water equivalent of the sn can be determined. The attenuation of the gam radiation depends only on the total mass of wa It does not depend on the state of the wa whether snow, ice or melt water. The gamma-field does depend however on the soil moist content in the top 30 cm to some extent. perience shows that the average water equival of the snow cover over large areas can be de mined with satisfactory accuracy with the gam ray survey method from an aircraft, and that results are in fact more reliable than conventio snow surveys on the ground. This is due to the that the small irregularities in the snow cover ar a large extent evened out when measured from air. (Knapp-USGS)

REDUCING EXCESS READOUTS FR DIGITAL STREAMFLOW RECORDERS,
Rocky Mountain Forest and Range Experime Station, Tempe, Ariz. Hydrology Lab.
Alden R. Hibbert, and Wilson B. Casner.
Water Resources Research, Vol 7, No 2, p 418, Apr 1971. 4 p, 2 fig, 1 ref.

Descriptors: *Data processing, *Stream ga *Data collections, *Computer programs, *Hy graphs, Water levels, Water level fluctuat Stage-discharge relations.
Identifiers: *Streamflow recorders.

Digital water level recorders on small, fl streams are frequently set at 5-minute readou tervals to define fluctuations during critical s flow periods. Consequently, during nons periods far more data points are punched on recorder tapes than are needed to define the

hydrograph. A two-step reduction process inates more than 95% of the original 105,000 points per year of record. The first reduction is ined by translating to IBM cards only every th (hourly) head value punched on the tape ng nonstorm periods. Storm periods are trans- at 5-minute intervals. A computer reduction on both hourly and 5-minute data then syste- cally rejects head values not essential to hydro- h definition. Rejection is based on differences evation and slope between successive head s. Computer output consists of cards and a g of the reduced data. (Knapp-USGS)

UNDWATER HYDROLOGY OF THE CALERO APACHE INDIAN RESERVA- , SOUTH-CENTRAL NEW MEXICO,
gical Survey, Washington, D.C.
Sloan and M. S. Garber.
ale by US Geological Survey, Washington, 20242, Price 75 cents. Geological Survey ologic Investigations Atlas HA-349, 1 sheet, Text, 2 fig, 4 map, 2 tab, 7 ref.

riptors: *Water resources development, ndwater, *Hydrogeology, *Withdrawal, Mexico, Water wells, Hydrologic data, ers, Aquifer characteristics, Water levels, r yield, Water quality, Chemical analysis, pitation (Atmospheric), Drainage, Climatolo-

ifiers: *Groundwater resources (N. Mex).

ndwater hydrology of the Mescalero Apache n Reservation, South-Central New Mexico is n by a one-sheet hydrologic atlas consisting of eralized geologic map and section, a map ng water levels and location of wells and gs, a map showing approximate distribution of pitation, an illustration showing a generalized graphic column, tables of chemical analyses of water from springs and wells, and a descriptive text. The Yeso Formation of Permain age is the most extensive aquifer in the reservation, with yields to wells from less than 1 gpm to more than 500 gpm. Total dissolved solids in water samples from the Yeso formation ranged from 358 to 2,210 mg/liter. Analyses of water from wells and springs on the Mescalero Reservation show dissolved solids content ranging from 358 mg/liter to 3,909 mg/liter. The water is generally of the calcium-magnesium sulfate or bicarbonate type with hardness generally ranging from 300 to 2,000 mg/liter. (Woodard-USGS)
W71-07927

GROUNDWATER RESOURCES OF WALSH COUNTY, NORTHEASTERN NORTH DAKOTA,
Geological Survey, Washington, D.C.
Joe S. Downey.
For sale by US Geological Survey, Washington, DC, 20242, Price $1.00. Geological Survey Hydrologic Investigations HA-431, 1 sheet, 1971. Text, 1 fig, 3 map, 2 tab, 6 ref.

Descriptors: *Water resources development, *Groundwater, *Hydrogeology, *Withdrawal, *North Dakota, Hydrologic data, Water wells, Aquifers, Aquifer characteristics, Water levels, Water yield, Water quality, Chemical analysis, Hydrographs.
Identifiers: *Groundwater resources, *Walsh County (ND).

This one-sheet (34 x 29 inches) hydrologic atlas consisting of illustrations, tables, maps, and a descriptive text summarizes groundwater resources in Walsh County in northeastern North Dakota. The county is almost entirely covered by glacial drift of till and glaciofluvial deposits ranging in thickness from about 300 feet in the eastern part of the county to about 30 feet in the western part. The largest and most productive glacial-drift aquifer is located near the city of Fordville, and is locally known as the Fordvilleaquifer. Four bedrock units supply water to wells in the Walsh County. The Pierre Shale yields from 1 to 5 gpm from fracture zones in the upper part of the formation. Wells tapping the Dakota Sandstone have been reported to yield as much as 500 gpm. Water from the Jurassic and Paleozoic bedrock formations is very saline and is unsatisfactory for most uses. Wells tapping the glacial-drift aquifers in Walsh County yield water with a wide range of chemical quality. (Woodard-USGS)
W71-07928

FLOODS IN SALINAS AREA, PUERTO RICO,
Geological Survey, Washington, D.C.
William J. Haire.
For sale by US Geological Survey, Washington, DC, 20242, Price $1.00. Geological Survey Hydrologic Investigations Atlas HA-477, 1 sheet, 1971. Text, 4 fig, 1 photo, 1 map, 5 ref.

Descriptors: *Floods, *Puerto Rico, Profiles, Stage-discharge relations, Flood damage, Maps, Mapping, Flood plains, Rainfall-runoff relationships, Hydrograph analysis, Depth-area-duration analysis, Planning, Zoning, Coastal plains.
Identifiers: *Salinas (PR), Hydrologic Atlas.

This one-sheet hydrological atlas covers the south coast of Puerto Rico between Ponce and Maunabo. It shows the water-surface profiles and areas inundated by the October 1970 flood and contains information pertaining to previous floods that are hydrologically significant. Floods occurred on most streams during the period October 5-10, 1970. The greatest floods occurred in an area east of a line extending from Arecibo to Ponce, which is the eastern two-thirds of Puerto Rico. Higher floods have occurred in other years in some areas but the floods of October 1970 were outstanding because of their duration and multiple peaks. The floods resulted from rainfall that totaled as much as 35 in at some places during the 6-day period. Rainfall came mostly in intense bursts. The drainage area of Rio Nigua is about 53 sq mi at the mouth at Mar Caribe. Rio Nigua flows across one of the most distinctive alluvial fans on the south coast. There are small diversion structures in Rio Lapa and Rio Majada for irrigation and water supply, but their storage capacity is negligible. The profile for the flood of October 1970 is shown and the flooded area is delineated on the map. The flood of August 1956 was slightly higher than the 1970 flood. The September 1928 flood, however, was 1 to 1.5 meters higher than the 1970 flood in the upper part of the coastal plain. The peak discharge of Rio Lapa near the mouth during the flood of October 1970 was 7,300 cfs (cubic feet per second), an average of 737 cfs per square mile of drainage area. The peak discharge of Rio Majada near its mouth was 13,000 cfs, an average of 580 cfs per square mile. (Knapp-USGS)
W71-07929

WATER-RESOURCES RECONNAISSANCE OF A PART OF THE MATANUSKA-SUSITNA BOROUGH, ALASKA,
Geological Survey, Washington, D.C.
Alvin J. Feulner.
For sale by the US Geological Survey, Washington, DC, 20242, Price 50 cents. Geological Survey Hydrologic Investigations Atlas HA364, 1 sheet, 1971. Text, 5 fig, 3 map, 2 tab, 3 ref.

Descriptors: *Water resources development, *Surface waters, *Groundwater, *Hydrogeology, *Alaska, Streamflow, Runoff, Aquifers, Aquifer characteristics, Water yield, Water levels, Water quality, Chemical analysis, Precipitation (Atmospheric), Hydrologic data, Water wells, Withdrawal, Surface-groundwater relationships.
Identifiers: *Water resources (Alas).

This one-sheet hydrologic atlas consisting of maps, graphs, tables of data, and a descriptive text summarizes the groundwater and surface water resources of the Matanuska-Susitna Borough, Alaska. Average cumulative discharge of all measured streams in the study area was about 28,000 cfs. The greatest yields of groundwater (more than 100 gpm) comes from wells in the flood plains and lowland areas adjacent to streams and rivers. These areas are underlain by glacial and alluvial deposits of sand and gravel. Groundwater in the study area has a greater chemical-quality variation than the surface water. It generally is harder than surface water, except in areas adjacent to streams where the water quality of both is similar. Much of the groundwater obtained from shallow wells drilled in the alluvium contains objectionable concentrations of iron, most of which could be easily removed by aeration and filtration of the water prior to storage or use. Groundwater ranges from about 50 to more than 200 mg/liter in hardness and is of the calcium bicarbonate type. (Woodard-USGS)
W71-07930

FLOODS IN GUAYAMA AREA, PUERTO RICO,
Geological Survey, Washington, D.C.
William J. Haire.
For sale by US Geological Survey, Washington, DC, 20242, Price $1.00. Geological Survey Hydrologic Investigations Atlas HA-446, 1 sheet, 1971. Text, 7 fig, 1 map, 1 tab, 5 ref.

Descriptors: *Floods, *Puerto Rico, Profiles, Stage-discharge relations, Flood damage, Maps, Mapping, Flood plains, Rainfall-runoff relationships, Hydrograph analysis, Depth-area-duration analysis, Planning, Zoning, Coastal plains.
Identifiers: *Guayama (PR), Hydrologic atlas.

This one-sheet hydrologic atlas is one of a series of four that covers the south coast of Puerto Rico between Ponce and Maunabo. This atlas shows the water-surface profiles and areas inundated by the October 1970 flood and contains information pertaining to previous floods that are hydrologically significant. The report has been prepared to provide a technical basis on which individuals, organizations, and governmental agencies can make

decisions leading to development on the flood plain compatible with the degree of flood risk. Floods occurred on most streams in Puerto Rico during the period October 5-10, 1970. The greatest floods occurred in the eastern two-thirds of Puerto Rico. The floods of October 1970 were outstanding because of their duration and multiple peaks. The volume of runoff was extraordinarily large. The floods resulted from rainfall that totaled as much as 35 inches at some places during the 6-day period. The rainfall came mostly in intense bursts. COST OF MUNICIPAL SEWAGE TREATMENT PLANTS IN ILLINOIS,
Illinois State Water Survey, Urbana.
Thomas A. Butts, and Ralph L. Evans.
State of Illinois, Department of Registration and Education Circular 99. 37 p, 16 fig, 12 tab, 5 ref.

Descriptors: *Comparative costs, Least squares method, *Regression analysis, *Waste water treatment, Water quality control, *Illinois, *Cost analysis, Construction costs, Maintenance costs, Operating costs, Trickling filters, Lagoons, Activated sludge, Digestion, Sludge, Costs, *Sewage treatment.
Identifiers: Municipal waste water.

Municipal sewage treatment facility costs for 291 plants constructed in Illinois between 1957 to 1968 are summarized. The eight categories of new plants analyzed are: (1) lagoons, (2) primary with heated digesters' (3) primary with vacuum filters' (4) trickling filter-digester; (5) trickling filter-Imhoff tank; (6) activated sludge, constructed in place, having population equivalents (P.E.) equal to or less than 10,000; (7) activated sludge, constructed in place, having a P.E. of greater than 10,000; and (8) factory built activated sludge units. Mean unit treatment costs in dollars/P.E. were obtained using the least squares regression analysis, considering construction, operating and land costs in the general geometric form of C — KPn, where C is either construction, operating, or land costs, K is a regression constant, P is the sewage treatment design capacity, and n is the slope of the least squares regression line. Two categories were also established for plant additions, namely trickling filter or activated sludge additions. The regression equation formulated for additions was of the form C — KPnSm, where C— cost of the addition, K— a regression constant, P— capacity of new addition, S— capacity of existing plant, and n,m& slope constants. Several examples of the applications of the preceding equations were included, along with a table which summarized the relative costs predicted through use of the equations. This cost analysis procedure was not designed to replace an in-depth engineering study for determining costs. However, use of the formulae presented will allow concerned parties to obtain a quick estimate of the relative costs of the various treatment schemes. (Lowry-Texas)

EARTH RESOURCES RESEARCH DATA FACILITY INDEX: VOLUME I, DOCUMENTARY DATA; VOLUME II, SENSOR DATA.
National Aeronautics and Space Administration, Houston, Tex. Manned Spacecraft Center.

NASA Manned Spacecraft Center Publication MSC-02576 (2 Vols), Jan 1971. 506 p (Vol I); 219 p (Vol II).

Descriptors: *Data collections, *Information retrieval, *Resources, *Remote sensing, *Satellites (Artificial), Aerial photography, Bibliographies, Documentation, Publications, Natural resources.
Identifiers: *Earth Resources Data Index.

This document, presented in 2 volumes, is the cumulative issue of the Earth Resources Research Data Facility (ERRDF) Index. Volume I lists all Earth Resources Program documentary information that is available at the National Aeronautics and Space Administration's Manned Spacecraft Center. Included in Volume II of the Index are sensor data collected during flights over test sites and from missions flown by subcontractors supporting the Earth Resources Survey Program. The information cataloged in the 2 volumes of this document is divided into 5 major data catagories as follows: Vol. I, Part 1 - Technical documents and maps; Part 2 - Satellite data; Vol. II, Part 3 - Functional and check out data; Part 4 - Imagery data; and Part 5 - Electronic data. (Knapp-USGS)

FLOOD STAGES AND DISCHARGES FOR SMALL STREAMS IN TEXAS,
Geological Survey, Austin, Tex.
E. E. Schroeder.
Interim Report 85-4 (Geological Survey Texas District Open-file Report No 124), 1971. 319 p, 6 fig, 4 tab, 7 ref.

Descriptors: *Streamflow, *Floods, *Peak discharge, *Flow measurement, *Texas, Flow rates, Discharge (Water), Rainfall-runoff relationships, Stream gages, Gaging stations, Rain gages, Data collections, Hydrologic data, Small watersheds.

This report is the fourth in a series of interim reports that describe the objectives, planning of the project, the instrumentation, the progress and status of the project, and the data collected during the water year (Oct. 1, 1967-Sept. 30, 1968), for small streams (less than 20 square miles drainage area) in Texas. A typical installation consists of two crest-stage gages; one headwater gage, and one tail water gage. The headwater gage is located up stream from the culvert at a distance approximately equal to one culvert width in order to record the true water-surface elevation upstream from any drawdown-zone disturbance. The tailwater gage is located downstream from the culvert to record the water-surface elevation at the culvert outlet. The differential head, determined from the difference in the recorded headwater and tailwater peaks, is then converted into a peak rate of flow by standard U.S. Geological Survey methods of computation. Additional hydrologic data are obtained at each site by a stage and rainfall recorder. (Woodard-USGS)
W71-08047

SURFACE WATER SUPPLY OF THE UNITED STATES, 1961-65: PART II. PACIFIC SLOPE BASINS IN CALIFORNIA, VOL 2, BASINS FROM ARROYO GRANDE TO OREGON STATE LINE EXCEPT CENTRAL VALLEY.
Geological Survey, Washington, D.C.

For sale by Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, Price $3.25. Geological Survey Water Supply Paper 1929, 1970. 673 p, 1 fig, 1 plate.

Descriptors: *Hydrologic data, *Data collection, *Streamflow, *Stream gages, *California, Surface waters, Flow rates, Average flow, Low flow, Peak discharge, Flow measurement, Reservoir stage, Lakes, Gaging stations, Discharge measurement.
Identifiers: *Pacific Slope Basins (Calif).

This volume of surface water supply for the Pacific Slope Basins in California from Arroyo Grande to Oregon stateline, except Central Valley, is one of a series of 37 reports presenting records of stage, discharge, and content of streams, lakes, and reservoirs in the United States during the 1961-65 water years. The tables of data include a description of the gaging station, and daily, monthly, and yearly discharges of the stream. The description of the station gives the location drainage area, records available, type and history of gage, average discharge, extremes of discharge, and general remarks. For most gaging stations on lakes and reservoirs, a description of the station and a monthly summary table of stage and contents are given. Data for partial-record stations include discharge measurements at low-flow partial-record stations and annual maximum stage and discharge at crest-stage stations. (Woodard-USGS)

CTED WATER RESOURCE RECORDS OKALOOSA COUNTY AND ADJACENT AS,
gical Survey, Tallahassee, Fla.
s B. Foster, and Charles A. Pascale.
la Bureau of Geology Information Circular 7, 1971. 95 p, 4 fig, 9 tab, 9 ref.

riptors: *Surface waters, *Groundwater, rologic data, *Data collections, *Florida, r resources, Rainfall, Stream gages, Chemical sis, Water temperature, Water wells, Water , Pumping, Geology, Petrology, Hydrogeolo- quifer characteristics, Aquifers, Hydrology.
ifiers: *Okaloosa County (Fla), Lithologic Streamflow measurements.

r resources records are presented for osa County, Florida, the upper drainage area al River, coastal areas in Walton County, and ed areas in Santa Rosa County. These records collected from January 1966 through Sep- r 1968. Geologic and hydrologic information resented in tables which group the data ac- ng to type. Maps of the area show the location ta collection stations within the county and ent areas. The tabulated surface-water data le station numbers, streamflow measure- s, chemical analyses, and water temperatures. ndwater records include wells inventoried, levels, pumpage, chemical analyses, water temperatures, and lithologic logs. Rainfall data are compiled, and the location of the rain gages are shown. (Woodard-USGS)
W71-08114

LOW-FLOW FREQUENCY OF WISCONSIN STREAMS,
Geological Survey, Washington, D.C.
Warren A. Gebert.
For sale by US Geological Survey, Washington, DC, 20402, Price $0.75 cents. Geological Survey Hydrologic Investigations Atlas HA-390, 1 sheet, 1971. Text, 3 fig, 1 map, 14 ref.

Descriptors: *Streamflow, *Low flow, *Frequency analysis, *Wisconsin, Stream gages, Flow characteristics, Discharge measurement, Gaging stations, Hydrographs, Water resources development, Base flow.
Identifiers: *Low-flow variability.

This one-sheet hydrologic atlas presents low-flow characteristics at 320 streamflow stations in Wisconsin. Knowledge of the magnitude and frequency of recurrence of low flows of streams is useful for planning, managing, and protecting the State's water resources. Planning and regulatory agencies can use low-flow frequency information for allocating water rights, administering water uses, developing water projects, and determining the availability of water. Industries and municipalities can use the information in seeking water supplies, as well as in determining the capacities of streams to dilute wastes. (Woodard-USGS)
W71-08115

SELECTED FLOW CHARACTERISTICS OF FLORIDA STREAMS AND CANALS,
Geological Survey, Tallahassee, Fla.
Richard C. Heath, and E. Turner Wimberly.
Florida Bureau of Geology Information Circular No 69, 1971. 595 p, 7 fig, 8 ref.

Descriptors: *Streamflow, *Flow characteristics, *Stream gages, *Hydrologic data, *Florida, Data collections, Discharge measurement, Low flow, Peak discharge, Duration curves, Average flow, Gaging stations, Reviews.
Identifiers: *Streamflow basic data (Fla).

Tables of flow duration, lowest mean discharge, and highest mean discharge for selected consecutive periods within each year through September 30, 1965, at 254 stream-gaging stations on Florida streams are presented. These tables summarize daily streamflow records needed to define flow characteristics at stream-gaging sites. The content of each of the three summary tables is described, and techniques for preparing flow-duration curves, and low-flow and high-flow frequency curves are explained. (Woodard-USGS)

Descriptors: *Navigable waters, *Locks, *Hydraulic structures, *Navigation, *Inland waterways, Engineering structures, Canals, Tunnels, Ships, Costs, Hydraulic transportation, Planning.
Identifiers: *France.

New approaches to improving and increasing navigable waterways in France are discussed under the following topics: (1) Canalization of rivers; (2) Tunnels; (3) Locks and elevators; (4) Negotiation of a crest by a canal; and (5) Water slope. The estimated costs of constructing and maintaining the facilities are given. The value of shipping time is formulated on the basis of time lost by a ship passing through a lock. For example, with a traffic of 10 million tons per annum, after making allowance for unavoidable periods of waiting, the average time lost is 50 minutes for a lock with a 10 m fall. This figure varies by one minute more or less per meter according to whether the fall is greater or smaller. A ship's average load is 2,000 tons, and the number of ships passing through the lock in a year is 5,000. One hour of lost time suffered by a ship represents a loss of 200 francs. The annual loss for one hour's delay amounts to: 200 X 5,000 — 1,000,000 francs. The total time value per meter of fall for the various lock fall heights are shown. (Woodard-USGS)

THE USE OF SYSTEMS ANALYSIS IN THE DEVELOPMENT OF WATER RESOURCES MANAGEMENT PLANS FOR NEW YORK STATE,
New York State Department of Environmental Conservation, Albany. Div. of Water Resources.
A. C. Tedrow, C. S. Liu, D. B. Halton, and R. A. Hiney.
Available from the National Technical Information Service as PB-199 539, $3.00 in paper copy, $0.95 in microfiche. Vol I, June 1970. 183 p, 36 fig, 11 tab, 18 ref. OWRR Project C-1126 (No 1586) (1).

Descriptors: *Systems analysis, *Optimization, *Dynamic programming, *Simulation analysis, *Water management (Applied), Multiple-purpose projects, River basins, Flood control, Mathematical models, Computer programs, Water resources development, Operations research.
Identifiers: Oswego River Basin.

A research project was developed to evaluate the use of systems analysis techniques in New York State's multiple purpose comprehensive water resources planning program. In conjunction with an on-going planning study, hydrologic models were developed for evaluation of various management schemes. The Oswego River Basin, located in central New York, was used as the vehicle for carrying out the project. In applying systems analysis techniques to the river basin, a number of models were constructed. Management programs were analyzed on two different time bases; one, an overall budgeting or allocating of waters to various purposes on a long time interval and the other, the operation of the physical system on a transient basis during flood periods. As a result, a monthly or 'conservation' simulation model, a monthly optimization model, and a flood simulation model were developed. Dynamic programming was applied to optimize the diversion operations and Hook's pattern search method optimized the storage operations for the multiple purpose river system. The 'conservation' model simulated the hydraulic operation of the lakes and water courses outlines. The flood routing model was a mathematical representation of a hydraulic system and consisted of the lakes and reservoirs in the Oswego River Basin and their connecting waterways. The models provided an excellent framework for management of the planning study, specifying data needs, and priorities on development of information. (See also W71-08186) (Kriss-Cornell)

OPERATING FORCES ON MITER-TYPE LOCK GATES,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. L. Grace, Jr., T. E. Murphy, and F. R. Brown.
Available from the National Technical Information Service as AD-718 219, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-651, June 64. 130 p.

Descriptors: *Locks, *Gates, *Pressure, *Canels, Inland waterways.
Identifiers: Kinematics, Torque, Panama, Miter type lock gates.

Tests to determine the force required to move miter-type lock gates throughout the opening and closing cycles were conducted in a flume with a single set of miter gates located approximately in its center. Three linkages, with different kinematics of the operating machinery, were studied (modified Ohio River, Panama, and Ohio River). Other variables investigated were: submergence of gate; operating time; lock chamber length; bottom clearance of gate; barges in lock chamber; nonsynchronous operation of gate leaves. Peak hydraulic resistance to operation occurred as the leaves entered and left the closed position. The modified Ohio River and Panama linkages resulted in peak resistance in terms of torque at the pintle about equal and 40 percent less than those of the Ohio River linkage. Increased submergence of the leaves or speed of operation increased hydraulic resistance, as did decreases in gate bottom clearance. Hydraulic resistance decreased as lock chamber length increased. Nonsynchronous operation of the gates slightly reduced peak torque. Barges in the lock chamber had no effect on torque values. A report by the Panama Canal on earlier model tests of the Panama linkage is included as Appendix A. (WES)

SPILLWAY FOR TYPICAL LOW-HEAD NAVIGATION DAM ARKANSAS RIVER, ARKANSAS. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. L. Grace, Jr.
Available from the National Technical Information Service as AD-718 218, $3.00 in paper copy, $0.95 in microfiche. WES Technical report, 2-655, June 64. 162 p.

Descriptors: *Dams, *Model studies, *Flow, *Spillways, Concrete, Arkansas construction materials.
Identifiers: Arkansas River, Riprap.

Investigations were conducted using 1:25-, 1:40, and 1:50-scale section models to determine optimum gate sill and pier nose shapes, spillway capacity with full and partial gate openings for both free and submerged flows, stilling basin performance, and riprap requirements for a typical low-head navigation dam such as planned for construction on the Arkansas River. Test results indicated that: (a) the parabola, X2 — 4OY, is the optimum gate sill shape; (b) an ogival pier nose is slightly more efficient than a semicircular nose; (c) apron elevations in the range of elevations tested do not affect discharge characteristics; (d) one row of 4-ft-high baffle piers and a 3-on-4-sloping, 4-ft-high end sill comprise the optimum stilling basin; (e) riprap downstream of the stilling basin is most stable when placed on a slope of 1 on 6; and (f) extension of the gate piers from the toe of the gate to the end of the stilling basin produces a more uniform scour pattern in the exit channel. PROTECTION OF NARRAGANSETT BAY FROM HURRICANE SURGES,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
H. B. Simmons.
Available from the National Technical Information Service as AD-718 220, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-662, June 64. 122 p.

Descriptors: *Breakwaters, *Model studies, *Surges, *Ocean waves, Shore protection, Tides, Navigation, Barriers, Salinity.
Identifiers: Tropical cyclones, Ocean currents, Military requirements, Hurricane surge, Providence (RI), Waste wash-out.

The design of barriers for protection of Narragansett Bay against inundation by hurricane surges required use of a comprehensive model to determine the effects of proposed structures on normal tide and hurricane surge heights, current velocities, the salinity regimen of the bay, and the rates of diffusion and flushing of pollutants discharged into the bay. Model tests indicated that barriers should not be located in the central portions of the bay because of excessive buildup of surge he

ynstream from such barriers, that a lower bay rier alone could not satisfy the requirements of Navy and at the same time afford the desired uctions in surge heights at upstream locations, that the combination of a gated structure at Fox nt for the protection of Providence with a em of lower bay barriers with ungated openings ld satisfy the requirements of the Navy for max- m current velocities and at the same time pro- hurricane surge protection throughout the bay em. However, current velocities and patterns in ated navigation openings would not be safe for igation by all craft which use Narragansett Bay. addition of gated openings in the East and t Passage barriers should provide a satisfactory tion to this problem. Such a plan should have letrimental effects on the salinity regimen of the the rates and patterns of diffusion and flushing vastes, or on shoaling of the navigation chan- (WES)

spillway, a low, broad-crested weir sur- nted by 8 gates, will be operated when the pool hes top-of-gate elevation; thus initial flows will harge into a dry exit channel under a 23.5-ft l. A 1:50-scale model was used to study spill- performance when this structure is the control supercritical flow predominates. A shallow -ft-deep), rectangular stilling basin was eloped which dispersed small flows and inated surface waves at large flows. Also a gate ration schedule was developed which, together the shallow basin, comprised the optimum hod of controlling flows on the apron nstream until submergence occurred. Tests of exit channel (a paved transition section and a ap-protected section leading to the unlined nnel) showed that sector walls could replace concrete transitions below the rectangular n, and that the paved apron and riprap section d be reduced in length. tifiers: Half Moon Bay (Calif).

entire Half Moon Bay Harbor basin, the sur- ding breakwater system with 600-ft-wide gation entrance, and sufficient coastline and ore hydrography to ensure accurate simula- of approaching waves were reproduced in a 0-scale hydraulic model equipped with wave- rating and wave-height measuring devices. model was used to determine the optimum lo- on and length of breakwaters necessary to pro- at minimum cost, adequate protection for sure craft and fishing boats berthed at the piers ng storm wave action. It was concluded that an added section of rubble-mound breakwater about 1050 ft long, which would extend the existing west breakwater in a southeasterly direction and provide a revised navigation entrance about 350 ft wide, would ensure the desired protection. Alternate breakwater plans were developed that also satisfied the selected wave-height-duration criteria. However, these plans involved more costly structures or had some overriding objectionable feature not characteristic of the plan recommended for construction. (WES)

NAVIGATION CONDITIONS AT MAXWELL LOCKS AND DAM, MONONGAHELA RIVER: HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. J. Franco, and C. D. McKellar.
Available from the National Technical Information Service as AD-718 679, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-672 Jan 65. 73 p.

Descriptors: *Dams, *Model studies, *Navigation, *Locks, Test procedures, Pennsylvania, River flow.
Identifiers: Multiphase flow, Flow fields, Monongahela River.

Maxwell Locks and Dam will consist of two parallel, 84- by 720-ft locks and a 460-ft-long, gated, nonnavigable dam. A 1:120-scale, fixed-bed model, reproducing about 2.4 miles of the relatively straight reach of the Monongahela proposed for the locks and damsite, was used to: (a) determine the most favorable site in the reach for the structures; (b) demonstrate flow conditions in the lock approaches; (c) assist in developing modifications of the approaches and structures to improve navigation conditions; and (d) determine flow and navigation conditions during the stages of construction of the locks and dam. Tests were concerned with the study of flow patterns, measurement of velocities in the lock approaches, and behavior of a model tow on entering and leaving the locks under flows ranging from 35,000 to 116,000 cfs. The results of the investigation indicated the following: (a) the locks and dam should be constructed 600 ft farther downstream than originally designed to increase the distance between the bend and the lock approach; (b) ports will be required in the upper guard wall to reduce or eliminate the intensity of crosscurrents at the end of the wall; (c) a large eddy will form in the lower approach, but the intensity of the currents in the eddy should not be sufficient to seriously affect the movement of tows approaching the lock; and (d) dredging will be required along the left bank below the dam to eliminate the excessive contraction and backwater effects produced by an underwater prominence and to improve navigation conditions in the lower approach. SPILLWAY, MILLERS FERRY LOCK AND DAM, ALABAMA RIVER, ALABAMA,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
G. A. Pickering.
Available from the National Technical Information Service as AD-717 979, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 3-643, Feb 64. 63 p.

Descriptors: *Dams, *Model studies, *Spillways, Flow, Construction costs.
Identifiers: Millers Ferry Lock and Dam (Ala), Alabama River.

The model of the gated spillway, constructed to an undistorted scale of 1:50, reproduced one 50-ft-wide gate bay and approximately half of each adjacent gate bay. The general purpose of the model study was to determine the flow characteristics over the spillway and to verify the adequacy of the stilling basin design. Tests revealed that flow separated from the downstream face of the original gate sill and a parabolic shape was added in order to guide flow into the stilling basin. The spillway rating curves were determined with full and partial gate openings for both gate sill shapes. The stilling basin as originally designed functioned satisfactorily below the curved sill shape, but alterations were tested in an effort to reduce construction costs. The altered basins were not as efficient as the original design; therefore, the original design is recommended. (WES)

DESIGNS FOR RUBBLE-MOUND BREAKWATER REPAIR, KAHULUI HARBOR, MAUI, HAWAII,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. A. Jackson.
Available from the National Technical Information Service as AD-717 980, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-644, Feb 64. 89 p.

Descriptors: *Breakwaters, *Model studies, *Harbors, Ocean waves, Concrete shore protection.
Identifiers: Protective coverings, Kahului Harbor, Maui (Hawaii), Rubble mound breakwater.

Tests were conducted on 1:68.5-scale models of breakwater sections to obtain data from which economical and stable designs could be developed for repair of the damaged breakwaters at Kahului Harbor. Proposed designs involved protective cover layers of 35and 50-ton tribar armor units. Design of the breakwater repair was difficult because of the large prototype design wave (34 ft high), the limited space between the concrete monoliths on the crowns of the existing breakwaters and the limits of the navigation channel and harbor basin, and the limited lifting capacity and horizontal reach of available construction equipment at Kahului. Repair designs were developed, for both east and west breakwaters, that would withstand the attack of the selected 34-ft prototype design wave. It was also determined that repairing the damaged portion of the west breakwater head would not cause damage to the undamaged portion of the head and trunk. (WES)

SPILLWAY FOR PROCTOR DAM, LEON RIVER, TEXAS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
E. S. Melsheimer, and T. E. Murphy.
Available from the National Technical Information Service as AD-717 981, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-645, Mar 64. 44 p.

Descriptors: *Dams, *Model studies, *Spillways, Pressure, Texas, Weirs.
Identifiers: Rivers, Procter Dam, Leone River.

The spillway will include a low weir with sloping upstream face and an ogee crest. The crest was designed for a head of 29 ft although heads up to 39 ft are expected. Tests were conducted in a 1:40-scale section model of the spillway to verify the adequacy of the proposed crest shapes with the upstream face of the weir on slopes of 3 on 2 and 3 on 3. Optimum pressure conditions and discharge coefficients were obtained with a crest shape which was tangent to the upstream face of the dam. (WES)

EFFECTS ON LAKE PONTCHARTRAIN, LA., OF HURRICANE SURGE CONTROL STRUCTURES AND MISSISSIPPI RIVER-GULF OUTLET CHANNEL,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
I. C. Tallant, and H. B. Simmons.
Available from the National Technical Information Service as AD-717 978, $3.00 in paper copy, $0.95

in microfiche. WES Technical Report 2-636, Nov 63. 113 p.

Descriptors: *Breakwaters, *Model studies, Flood control, Surges, Hurricanes, Drainage, Shore protection, Tides, Lakes, Louisiana, Gulfs, Salinity, Barriers, Inland waterways.
Identifiers: Tropical cyclone, Damage, Inland waterways, Lake Pontchartrain, New Orleans (La).

A system of barriers along the south shore and across the eastern end of Lake Pontchartrain has been proposed as a plan for protecting New Orleans from hurricane damage. A model study was conducted to determine the effect of these barriers and also that of the Mississippi River-Gulf Outlet Channel (now under construction) on the hydraulic and salinity regimen of Lake Pontchartrain and adjoining lakes. It was concluded that: (a) freshwater inflow must be given equal consideration with any plan for modification of the salinity regimen of the lake system; (b) the proposed control structures for Chef Menteur and Rigolets would have little adverse effect on salinities and tidal heights; (c) the connection of the Gulf Outlet Channel to Lake Pontchartrain will increase salinity in the lake such that a control structure will be required; (d) complete closure of all structures during a hurricane would not cause adverse salinity conditions or increase the high-water elevation by more than 1.4 ft msl; (e) operation of the Bonnet Carre Spillway at design flow with the Gulf Outlet Channel connected and hurricane structures installed in the passes would raise the high-water elevation to 1.4 ft msl. TYPICAL SPILLWAY STRUCTURE FOR CENTRAL AND SOUTHERN FLORIDA WATER-CONTROL PROJECT,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. L. Grace, Jr.
Available from the National Technical Information Service as AD-717 977, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-633, Sep 63. 69 p.

Descriptors: *Dams, *Model studies, *Flow, *Spillways, Drainage, Flood control, Florida.

A typical control structure, a low ogee spillway with vertical-lift gates, was studied on a 1:16-scale model to determine the effects on discharge characteristics of various approach and exit channel elevations under free and submerged, uncontrolled and controlled flows. Results indicated that the discharge characteristics for each type of flow can be satisfied by certain equations. The approach depth does not affect submerged-flow discharge coefficients, and approach depths greater than the design head do not appreciably affect free-flow coefficients. However, approach depths less than the design head do affect free-flow coefficients. Exit channel elevations affect uncontrolled flow more than controlled (almost no effect), and free more than submerged. There is a critical exit channel elevation at which the structure's efficiency in passing uncontrolled flows is greatly reduced. The test data do not permit a complete solution of the problem, but do afford a firmer basis for design. Additional model and field data are needed for a complete solution. (WES)

OUTLET WORKS, DEGRAY DAM, CADDO RIVER, ARKANSAS: HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
D. R. Bucci.
Available from the National Technical Information Service as AD-718 683, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-684, Vicksburg, Miss, July 1965. 20 p, 21 photos, 32 plates.

Descriptors: *Dams, *Model studies, *Sluice gates, Test procedures, *Outlets, Flow, Pressure, *Stilling basins.
Identifiers: Arkansas, Caddo River, Degray Dam.

The model investigation of the single-tunnel outlet works was concerned with developing a stilling basin suitable for high diversion flows (up to 28,000 cfs) and high-energy flood-control releases (up to 6000 cfs). The 1:23-scale model reproduced the intake tower, tunnel, stilling basin, and exit channel. Both a slide-gate and a cylinder-gate intake tower were tested. The cylinder-gate tower operated with a lower head loss and with less tendency to cause surging than did the slide-gate tower. A stilling basin requiring minimum excavation and providing satisfactory energy dissipation of both diversion and flood-control releases was developed. (WES)
W71-07793

SPILLWAY FOR AMISTAD DAM, RIO GRANDE, MEXICO AND UNITED STATES. HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. L. Grace, Jr.
Available from the National Technical Information Service as AD-718 223, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-653, Aug 64. 98 p.

Descriptors: *Dams, *Model studies, Concrete, Soils, Foundations, Spillways, Stilling basins, Abutments, Walls, Drainage, Hydrostatic pressure.
Identifiers: Altitude, Amistad Dam, Rio Grande River, Weirs.

This report presents the results of tests conducted on a 1:70-scale section model reproducing one-half of the spillway for Amistad Dam, a combination concrete gravity and earth embankment structure rising 253 ft above the bed of the Rio Grande. The spillway consists of an ogee crest controlled by 16 tainter gates, 50 ft wide and 54 ft high, and a hydraulic jump type stilling basin. The spillway will be flanked on each side by a powerhouse. Discharge characteristics of the spillway, hydrostatic pressures on the ogee weir crest, lateral pressures on the gate piers, performace of both single- and double-stage stilling basins at various elevations, and the height and length of both spray and stilling basin training walls were investigated. The theoretical spillway rating curve and the expected hydrostatic pressures on the weir crest were in close agreement with those determined with the model. Stilling basin performance of the original design was found to be unsatisfactory. However, satisfactory stilling basin designs were developed for three apron elevations. The height of the original spray wall was found to be inadequate due to the effect of the abutment on the water-surface profile. The original height and length of the stilling basin training walls were found to be the optimum. (WES)
W71-07794

SELECTION OF OPTIMUM PLAN FOR REDUCTION OF WAVE ACTION IN MARINA DEL REY, VENICE, CALIFORNIA: HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
C. W. Brasfeild.
Available from the National Technical Information Service as AD-718 684, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-671, Vicksburg, Miss, Jan 1965. 21 p, 6 tab, 20 photos, 16 plates.

Descriptors: *Breakwaters, *Model studies, Ocean waves, Tides, California, Test procedures.
Identifiers: Ocean models, Marina del Rey, Venice (Calif).

A 1:75-scale model, molded in concrete, was used to develop an optimum plan of improvement for reducing wave heights to a satisfactory level within the harbor of Marina del Rey. The marina consists of a 2-mile-long channel and eight lateral basins. The model reproduced the entire harbor and enough of adjacent Santa Monica Bay to allow propagation of the required test waves. A 40-ft long wave machine and electrical wave-height measuring and recording apparatus were utilized in model operation. It was concluded from test results that a 2325-ft-long, wing-type, offshore rubble mound breakwater in front of the harbor entrance offered greater protection to the entire harbor area than any of the other plans tested. Although other plans were developed which furnished adequate protection to the individual basins, they were not as efficient as the breakwater in reducing wave heights in the harbor entrance and main channel. FILLING AND EMPTYING SYSTEM JONESVILLE LOCK, QUACHITA-BLACK RIVERS, LOUISIANA: HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
N. R. Oswalt, J. H. Ables, Jr., M. B. Boyd, and T. E. Murphy.
Available from the National Technical Information Service as AD-718 681, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 2-671, Vicksburg, Miss, June 1965. 25 p, 16 tabs, 16 plates.

Descriptors: *Dams, *Model studies, *Locks, *Flow control, Vortices, Louisiana, River flow, Intakes, Outlets.
Identifiers: Water entry, Black River, Quachita River.

The filling and emptying system of the 600- by 84-ft Jonesville Lock will consist of wall intake manifolds, a 10- by 10-ft longitudinal culvert in each wall, reverse-mounted tainter valves, sidewall ports, and sidewall outlet manifolds. Normal operating heads will range from 15 to 30 ft. The hydraulic system was tested in a 1:25-scale model which simulated all essential features of the prototype. The original design intake and outlet manifolds performed satisfactorily. Tests of the sidewall port arrangements resulted in the adoption of 17 ports per culvert spaced 20 ft on centers with 8- by 8- by 2-ft-deep recesses in the lock chamber floor in front of each port. With the adopted hydraulic system installed in the model, hawser stresses on 4- and 6-barge tows were well within the 5-ton limit during operation at normal. (WES)

Descriptors: *Dams, *Model studies, *Fluid flow,
*Spillways, *Stilling basins, Sluices, Energy dissipa-
tion, Pennsylvania.
Identifiers: Drainage, Allegheny Dam, Allegheny
River, Stilling basins, Baffle piers.

Investigation of the spillway and sluices on a 1:36-
scale model involved verification of hydraulic per-
formance of the spillway, refinement of the stilling
basin design, and selection of high-level and low-
level sluice designs. Tests indicated that the max-
imum expected discharge (140,000 cfs) was
satisfactorily passed by the spillway and the six low-
level sluices at a head on the spillway crest of 29 ft.
A high-level sluice, discharging through the spill-
way spray walls, with its major axis parallel to the
spillway slope, effectively spread flow across the
spillway weir. A horizontal low-level sluice with
flared exit and tetrahedral deflector provided good
flow distribution in the basin. The stilling basin ef-
fected satisfactory energy dissipation with the
apron raised 3 ft and the baffle pier pier height
decreased 3 ft. (WES)

**FLOW CHARACTERISTICS IN FLOOD-CON-
TROL TUNNEL 10, FORT RANDALL DAM,
MISSOURI RIVER, SOUTH DAKOTA.
HYDRAULIC PROTOTYPE TESTS,**
Army Engineer Waterways Experiment Station,
Vicksburg, Miss.
J. V. Dawsey, Jr., C. J. Huval, and W. C. Blanton.
Available from the National Technical Information
Service as AD-717 974, $3.00 in paper copy, $0.95
in microfiche. WES Technical report 2-626, June
1963. 84 p.

Descriptors: *Dams, *Fluid flow, *Flood control,
*Underground structures, Model studies, Tunnels,
Missouri River, Anemometers, Flow meters, Data
processing.
Identifiers: Transducers, Four Randall Dam, Data
reduction, Flood control tunnels.

Tests were conducted in tunnel 10 to investigate
flow characteristics of a large circular tunnel, flow-
ing full. Measurements included pressures in the
tunnel intake and along the tunnel, and velocity
distributions obtained from nine total-head tubes
mounted on a streamlined strut spanning the tunnel
horizontally. The strut instrumentation also in-
cluded six pressure transducers and three hot-film
anemometers. The electrical signals from the trans-
ducers and anemometers were recorded on both
oscillographs and magnetic tape. Total-head tubes
mounted on boundary zone probes were used to
traverse the region of flow near the wall. Intake and
transition pressures were generally lower than
those measured in a previous model study of the
tunnel. Resistance coefficients indicate an interior
surface intermediate between hydraulically smooth
and rough. (WES)

Service as AD-717 975, $3.00 in paper copy, $0.95
in microfiche. Technical report 2-628, June 1963.
92 p.

Descriptors: *Breakwaters, *Navigation, *Harbors,
*Waves (Water), Flowmeters, Storms, Currents
(Water), Velocity, Model studies.
Identifiers: Water traffic, Lorain Harbor, Lorain
(Ohio).

A 1:125-scale model of the harbor and adjacent
areas, equipped with wave-generating and -measur-
ing devices, was used to determine the optimum
length and alignment of a proposed detached
breakwater lakeward of the existing breakwater
system, and the optimum shape and width of
navigation opening to protect the harbor entrance
and mooring area from storm waves and currents,
and to improve navigation conditions for large ves-
sels. Five of the ten plans tested met the wave-
height and current-velocity criteria. The recom-
mended plan of these five, based on economy of
construction, provides for a 2250-ft-long detached
breakwater and the removal of 300 ft of the exist-
ing east breakwater. (WES)

**NAVIGATION AND SEDIMENTATION CONDI-
TIONS AT TYPICAL LOCK AND DAM, AR-
KANSAS RIVER, ARKANSAS AND
OKLAHOMA,**
Army Engineer Waterways Experiment Station,
Vicksburg, Miss.
J. J. Franco, and C. D. McKellar, Jr.
Available from the National Technical Information
Service as AD-717 973, $3.00 in paper copy, $0.95
in microfiche. Technical report 2-623, Apr 1963.
58 p.

Descriptors: *Dams, *Sedimentation, *Navigation,
Inland waterways, Rivers, Oklahoma, Arkansas,
Shoals, Mississippi River.
Identifiers: Site selection, Water traffic, Arkansas
River, Moveable-bed model.

As part of the studies for development of a naviga-
ble waterway from the Mississippi River to the
general area of Tulsa, Oklahoma, a movable-bed,
distorted scale model of a typical 5-mile reach of
the Arkansas River was used to study problems in-
volved in the location, design, and operation of a
lock and dam on an Arkansas River bend. Principal
conclusions were: (1) The lock and dam should be
placed as far downstream of the point of the convex
bar as possible to minimize crosscurrents and
scouring in the upper approach. (2) Ports will be
required in the upper guard wall of the lock to
reduce the intensity of the crosscurrents near the
end of the guard wall. (3) Shoaling in the lower
lock approach, which would tend to be heavy,
could be reduced by a wing wall at the end of the
lower guard wall. (4) There is no appreciable dif-
ference between a stepped-sill and a level-sill dam
insofar as the movement of sediment is concerned.

**SPILLWAY AND SLUICES, RED ROCK DAM,
DES MOINES RIVER, IOWA: HYDRAULIC
MODEL INVESTIGATION,**
Army Engineer Waterways Experiment Station,
Vicksburg, Miss.
D. R. Bucci, and T. E. Murphy.
Available from the National Technical Information
Service as AD-718 680, $3.00 in paper copy, $0.95
in microfiche. WES Technical report 2-673, Mar
1965. 98 p.

Descriptors: *Dams, *Model studies, *Spillways,
*Sluice gates, Iowa, Cavitation, Test procedures,
River flow, Pressure.
Identifiers: Des Moines River, Red Rock Dam.

The spillway and sluices of Red Rock Dam were
studied on a general model of the spillway and on a
section model of the sluice outlet. Particular
emphasis was given determination of the maximum
elevation of the stilling basin apron and minimum
height of the training walls. Studies were also con-
ducted to determine pressure conditions at the slu-
ice outlet portals and the effect of spillway flow on

the capacity of the sluices. The combined capacity of the spillway and sluices was less than computed because of losses at the spillway abutments and the effect of the spillway nappe on the sluice flow. The recommended stilling basin utilized a 206.48-ft-long apron at elevation 654 surmounted by two rows of 12-ft-high baffle piers and a 10-ft-high end sill. The training walls performed satisfactorily with their tops at elevation 715. This basin barely maintained the hydraulic jump at the spillway design flood. The sluice outlet model tests indicated that cavitation will not occur at the sluice outlet portal under the proposed method of combined spillway-sluice operation. As a check on this conclusion, the Folsome Dam high-level sluice was reproduced in this model. (WES)
W71-07805

STABILITY OF SOUTH JETTY SIUSLAW RIVER, OREGON, HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. A. Jackson.
Available from the National Technical Information Service as AD-717 976, $3.00 in paper copy, $0.95 in microfiche. WES Technical report 2-631, July 1963. 58 p.

Descriptors: *Jetties, *Rock fills, *Sea walls, *Model studies, *Harbors, Rock properties, River training, Water waves, Stability, Rehabilitation.
Identifiers: Siuslaw River.

Tests were conducted on 1:50-scale models of jetty sections to obtain design criteria for rehabilitation of the south jetty at the mouth of the Siuslaw River, and for similar jetties at the entrances to rivers along the Washington and Oregon coasts. The tests were also concerned with evaluating a special method of stone placement, developed by the Portland District. It was concluded from the investigation that: (1) one layer of quarrystones placed on the crown and on side slopes of 1:1.5 would be suitable for the repair of jetties situated in water depths less than about 16 ft, and design-wave heights not greater than 13 ft; (2) two layers of quarrystones on side slopes of 1:2 from crown to low-tide elevation would be suitable for the repair of jetties situated in water depths greater than 16 ft, and for design-wave heights as large as 17 ft; (3) at the jetty head, two layers of quarrystones at the junction of the head and trunk to four layers along the line of the jetty shoulder are needed for adequate protection; and (4) the special Portland District method of placement slightly improves the stability of the quarrystone cover layers compared with other random placement methods. AN EVALUATION OF OKRA GUM AS A DRAG REDUCING ADDITIVE IN PIPE FLOW,
Clemson Univ, S.C. Dept. of Engineering Mechanics.
Joseph George Neuwirth, Jr.
M.S. Thesis, Clemson University, Aug 1970. 71 p, 19 fig, 19 ref, append. OWRR Project A-009-SC (2).

Descriptors: *Friction, *Fluid friction, Flow, *Pipes, Hydraulics, Viscosity, *Lubricants.
Identifiers: Friction reduction, *Okra gum, Guor gum, Polyethylene oxide.

The specific purpose was to study the relation of additives to the phenomenon of drag reduction by constructing and instrumenting suitable flow systems that would perform within both the laminae and turbulent flow regimes. Okra gum in aqueous solution is a very effective drag reducing additive. Friction reduction was not related to any property changes since viscometric measurements showed apparently Newtonian behavior for concentrations as high as 250 weight parts per million (WPPM). Solutions with okra gum displayed superior friction reducing characteristics for low Reynolds number flows with an optimum effect resulting from a concentration of 25 WPPM as compared to 50 WPPM with polyethylene oxide. Although there was no indicated drag reduction onset point for the okra gum, its behavior indicated that its viscoelastic properties and molecular structure were comparable to that of guar gum and polyethylene oxide.

RELATIONSHIP BETWEEN THE RATE OF SHORE DEFORMATION AND FLOW VELOCITY (RUSSIAN: ZAVISIMOST' INTENSIVNOSTI BEREGOVYKH DEFORMATSIY OT SKOROSTI POTOKA),
Moscow State Univ., (USSR).
N. A. Milhaylova, and O. B. Shevchenko.
Meteorologiya i Gidrologiya, No 12, p 80-83, Dec 1970. 4 p, 2 fig, 5 ref.

Descriptors: *Deformation, *Shore protection, *Beach erosion, *Flow rates, *Sediment transport, Channels, Flumes, Channel morphology, Channel erosion, Dikes, Bottom sediments.
Identifiers: *USSR, Flow velocity, Channel deformations, Bottom erosion.

A deformation rate defined as the ratio of the change in the value of a certain channel characteristic to time is used to describe the interaction of flow and a deformable bottom, and the interaction of flow and erosible shores. Data on the rate of shore deformations and flow velocity for an entire channel width suggest that flow velocity is one of the principal factors determining the rate of shore deformations. Characteristics of depth deformations and the discharge and transport rate of a stream are determined by average depth of velocity, velocity at a distance of several particle diameters, and velocity at a distance of one-eighth of the width of the channel from the shore. T graph derived shows a sharp decrease in the rate deformations as a result of shore protection tetrahedrons and pile dikes. Laboratory stud were conducted in a channel flume 23 m long, 4 wide and 1 m high, using Lyubertsy sand 0.25 n in size. (Josefson-USGS)

TRANSFORMATIONS OF BREAKING WA CHARACTERISTICS OVER A SUBMARI BAR,
Michigan State Univ., East Lansing. Dept. Geology.
William L. Wood, Jr.
Available from the National Technical Informat Service as AD-718 904, $3.00 in paper copy, $0 in microfiche. Dept. of Geology Technical Rep No 4, Dec 1970. 116 p. ONR 388-089.

Descriptors: *Beaches, *Ocean waves, *La *Beach erosion, Lake Michigan, Lake beds.
Identifiers: *Lake waves, Wave functions, Oc bottom, Great Lakes, Submarine bars.

The effect of a submarine bar on the transfor tion of breaking wave characteristics is to crea filter on wave celerity and length. The degree of tering is directly related to the intensity of w breaking. The filtering effect of the submarine suggests that this is the reason for better agreem between observed wave parameters and theor the reforming zone shoreward of the subma bar. The role of turbulence of flow induced breaking is the most important factor in w height attenuation shoreward of the submarine As a result theoretical expressions for sha water wave transformations in the nearshore z must take turbulent dissipation into considera as a major factor.

Descriptors: *Dynamic programming, *Optim tion, *Systems analysis, *Distribution syst *Design, *Digital computers, Conduits, Pipeli Costs, Constraints, Pressure, Water transfer.

A method based on dynamic programming systems analysis wasdeveloped for optimizi fluid distribution system. For the purpose of te the dynamic programming technique in analy the tremendous number of system alternatives in optimizing system design, a simple water t port system (serial type) was first considered sisting of N pipe segments with known cha teristics jointed in a straight line. The desig responsibility was to evaluate all possible alte tives and select the most economical design. method included measurement of the system e tiveness, consideration of transformations and straints, and the use of dynamic programmi order to decompose the problem so decisions proceed one or two at a time with the use digital computer. Stagewise optimization achieved and the problem was converted fr multiple decision single-stage problem into a m ple stage single-decision problem. The optimiz logic was outlined in a flow chart and an exa where the design engineer must minimize a cost for a 200-ft. pipeline was described and so It was observed that input pressure and pipe figuration have a considerable influence on the of transporting fluid. writer of the discussion describes his own in-
gation into one aspect of flows which may
t when heated water is discharged from a
nel into a reservoir containing cooler water,
ly, where the discharge from the channel out-
s internally supercirtical. An analysis of an en-
ing jump controlled by a skimmer gate is
nted. The author's classification of two layer
ified flows is extended by the writer, who con-
s the effect of entrainment in the transition
on the characteristics of the layer
nstream. Three equations are used for this pur-
(1) continuity of density difference in the
on comprising entraining and roller zones; (2)
ibrium of the horizontal momentum flux and
ure force per unit width upstream and
nstream of the jumps; and (3) energy conserva-
downstream. The writer concludes that when
idering maximum efficiency of cooling ponds
eat dissipators, the problem of designing the
ng water outfall becomes that of maintaining a
ied internal jump at the outfall. (Oleszkiewicz-
derbilt)

SHORT TERM PROSPECTS FOR IMPROVING EFFICIENCY OF POWER PLANTS,
Massachusetts Inst. of Tech., Cambridge.
Herbert H. Woodson.
In: Electric Power and Thermal Discharges; Thermal Considerations in the Production of Electric Power. Gordon and Breach, New York, p 269-279, 1971.

Descriptors: *Thermal pollution, *Thermal powerplants, *Nuclear powerplants, *Efficiencies, *Cooling, *Cooling water.
Identifiers: *Fossil-fueled powerplants, *Combustion gas turbines, Reactors, Gas-cooled reactors, Breeder reactors.

For fossil-fueled plants, it appears that short term improvements in efficiency will most likely come from combined cycles using combustion gas turbines as topping units with steam cycles. Another technically possible concept for improved efficiency is the binary vapor cycle but much development work would have to be done on it. Light-water, nuclear-fueled plants will have small evolutionary increases in efficiency over the short term. Significantly higher efficiency in nuclear plants could result from widespread use of the high-temperature, gas-cooled reactor. Advanced breeder reactors with significantly higher efficiencies have a chance of making a commercial appearance over the short term. (See also W71-08298) (Oleszkiewicz-Vanderbilt)

SEISMIC ACTIVITY IN THE VICINITY OF SAN LUIS RESERVOIR,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
George C. Rouse.
Available from the National Technical Information Service as PB-197 327, $3.00 in paper copy, $0.95 in microfiche. Report REC-OCE-70-52, Nov 1970. 7 p, 5 fig, 2 tab, 4 ref.
Identifiers: Earth dams, Seismic studies, Earthquake engineering, Seismology, Seismic investigatations, Earthquakes, California, Central Valley Project, Faults geology, Seismic waves, Reservoir design, Reservoir sites, Seismographs, San Luis Reservoir (Calif), San Luis Dam (Calif), San Andreas Fault (Calif), Ortigalita Fault (Calif).

For many years, engineers have been concerned that loads produced by large reservoirs on the earth's crust could cause earthquakes. This problem was first investigated during the initial filling of Lake Mead by making seismic recordings at 3 locations near this lake. Data obtained from these recordings indicated that crustal loadings produced by the reservoir did not cause an increase in local earthquakes. A similar study was made during the filling of San Luis Reservoir, a 2,100,000-acre-ft body of water located near Los Banos, Calif. The reservoir is in an area which has been subjected to intense activity. A portion of the Ortigalita Fault extends beneath the lake area, and the San Andreas Fault passes within 22 mi of this location. Data obtained during the San Luis seismic investigation also furnish little or no indication that reservoir loadings on the earth's crust cause an increase in local earthquakes.

INVESTIGATION OF NONMETALLIC WATERSTOPS, REPORT 5. RETENTIVITY OF LABYRINTH-SHAPED WATERSTOPS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Billy J. Houston.
Available from the National Technical Information Service as AD-718 226, $3.00 in paper copy, $0.95 in microfiche. WES Technical Report 6-546, Vicksburg, Miss, Jan 1971. 10 p, 2 tab, 6 photos.

Descriptors: *Sealants, *Environmental effects, *Leakage, Water pressure, Hydraulic systems, Concrete, Rubber, Plastics, Failure (Mechanics), Joints (Connections), Degradation, Weathering.
Identifiers: Polyvinyl chloride, Shear stresses, Separation, Synthetic rubber, Labrinth shaped waterstops, Water retention.

This is the fifth report in the Investigation of Nonmetallic Waterstops series, and presents the results of tests conducted to evaluate the water-retaining properties of labyrinth-shaped waterstops of two shapes. The advantage of labyrinth waterstops over waterstops of conventional shape is that the use of labyrinth waterstops does not require splitting and bracing of concrete forms so that the waterstop can protrude from one placement into the area where the next placement will come. Since the Corps of Engineers is now allowing the use of labyrinth waterstops under certain conditions where little or no differential joint movement is expected, there was a need to know how well labyrinth waterstops inhibit the passage of water through a joint. Report 4 of the series included the results of water-retentivity tests of conventional waterstops of four shapes, and the results of the tests of the labyrinth waterstops reported herein are compared with those results obtained earlier. The results of the tests and comparisons indicate that labyrinth waterstops are as effective in retaining water as conventionally shaped waterstops when there is no joint separation. Tests reported herein indicated that a joint separation of 1/4 in. seriously reduces the water-retaining properties of labyrinth waterstops, but an opening of 1/8 in. can be tolerated when hydraulic pressure behind the waterstop is below 100 psi. Apparently, failure of the seal when a joint is open even a small amount and hydraulic pressure is applied is caused by the pressure acting perpendicular to the concrete ridges within the waterstop, causing the concrete to fail in flexure. GUNITE GIVES NEW LIFE . . . TO AN OLD, FALLING BRICK SEWER SYSTEM,
William M. Englerth.
Am City, Vol 85, No 7, p 101-102, Jul 1970.

Descriptors: *Sewers, *Construction, *Gunite, Repairing, Costs, Tennessee, Concretes, Linings.
Identifiers: *Chattanooga (Tenn), Sewer lining, Capacity.

A visual inspection of the brick sewer system in Chattanooga, Tennessee resulted in its rehabilitation with pneumatically applied reinforced concrete lining, known as gunite. This repair method reduces the carrying capacity; however, the newly lined surface reduces many existing friction losses in the deteriorating conduit, and capacity in the repaired sewer is increased from the higher flow velocities. A total of $633,113.70 was needed to repair the main brick sewers in the downtown area of Chattanooga.

SEAWATER CORROSION TEST PROGRAM SECOND REPORT,
Dow Chemical Co., Freeport, Tex.
H. C. Behrens, C. F. Schrieber, O. Osborn, L. Rice, and B. P. Webb.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402, Price $1.25. Office of Saline Water Research and Development Progress Report No 623, Dec 1970. 113 p, 48 fig, 9 tab, 11 ref, 2 append. OSW Contract 14-01-0001-2150.

Descriptors: *Corrosion, *Desalination, Deaeration, *Steel, *Aluminum, Aluminum alloys, Stainless steel, *Alloys, *Temperature, Dissolved oxygen, Carbon dioxide, Sea water, Saline water, Metals.
Identifiers: Mild steel, Low alloy steel, Corrosion rates.

Hot seawater performance was considered for a mild steel, a high-strength, low alloy steel, three experimental low alloy steels, four stainless steel wrought and cast alloys, seven aluminum alloys, and one Alclad composition. Variables of dissolved oxygen, temperature, velocity, pH, and refreshment rate of seawater were considered. Low alloy steel corrosion rates were 30 percent less than mild steel for the same oxygen concentration. This advantage was pronounced through 300-ppb oxygen concentration levels. Mild steel was sensitive to temperatures above 225F; less sensitive below. Optimum conditions for aluminum alloys in hot seawater is acidic pH at 50 to 100 ppb oxygen. Aluminum is possibly independent of oxygen after preconditioning. Alloys 3003 and 5454 showed highest level of performance. Alclad alloy 7072 self corrosion rate too high for satisfactory service life. (Filban-Office of Saline Water)
W71-07975

INVESTIGATION OF GALVANICALLY INDUCED HYDRIDING OF TITANIUM IN SALINE SOLUTIONS,
Battelle Memorial Inst., Richland, Washington. Pacific Northwest Labs.
L. A. Charlot.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402, Price $0.50. Office of Saline Water Research and Development Progress Report No 624, Dec 1970. 40 p, 11 fig, 8 tab, 18 ref, append.

Descriptors: *Corrosion, *Desalination, *Titanium, *Temperature, *Hydrogenation, Metals, Alloys, Inorganic compounds, *Steel, Stainless steel.
Identifiers: Titanium-Hydride, Galvanic-Couples, Nickel alloy.

Galvanically induced hydriding of commercially pure titanium and titanium-2 nickel alloy was determined in 3.4 wt percent NaCl air-sparged and argon-sparged solutions at 140, 265, and 390F. Hydrogen charging of the titanium via couple assemblies of titanium to aluminum, titanium to mild steel, titanium to copper, titanium to nickel, and titanium to stainless steel was measured by high temperature vacuum extraction analysis of the exposed titanium metal. The presence of hydrogen in the titanium was verified by metallographic analysis, which also showed the distribution of hydrogen in the metal. Assessment of corrosion, apart from hydriding, of both members of the galvanic couple was made by weight change determinations and visual inspection. Galvanic couples were withdrawn from the test after 14, 42, 72, and 146 days at temperature and destructively analyzed to yield the required data. A corrosion performance ranking from least to most corrosion resistant for the metals coupled with titanium in the 140F argon-sparged test (least aggressive) is Al AA Mild Steel A Cu — Ni — Stainless Steel. In the 390F air-sparged test (the most aggressive), the extent of corrosion of the dissimilar metals necessitated removal of aluminum and mild steel from the test after 14 days at temperature and removal of all samples after 72 days exposure. A relative ranking for this test is Al AA Mild Steel AA Cu — Stainless Steel A Ni. (Filban-Office of Saline Water)
W71-07976

DEVELOPMENT OF A CALIBRATION MODULE FOR TRACE OXYGEN ANALYZERS,
Aerojet-General Corp., El Monte, Calif.
H. C. Edgington, and R. M. Roberts.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402, Price $1.25. Office of Saline Water, Research and Development Progress Report No 625, Dec 1970. 140 p, 17 fig, 27 tab, 7 ref, 2 append. OSW Contract 14-01-0001-2127.

Descriptors: *Desalination, *Dissolved oxygen analyzers, *Volumetric analysis, Oxygen, Oxygenation, Dissolved oxygen, Analytical techniques.
Identifiers: Winkler Method.

The design, fabrication, and testing of a Dissolved Oxygen Calibrator is described. The calibration module achieves deoxygenation in a two-stage spinning-disc stripper by flowing feedwater and oxygen-free nitrogen gas countercurrently. Oxygen is added by coulometric generation into the second-stage nitrogen purge gas. This instrument gives D. O. contents of 0 to 100 ppb which are accurate to within plus or minus 2 ppb. Inasmuch as existing methods for D. O. analysis were of undetermined accuracy, a parallel research was conducted which resulted in the development of an Aerojet-modified Winkler procedure. The novel features of this improved method include (1) sampling, fixing, and titrating under a nitrogen atmosphere, (2) treating the sample by a novel combination of single and double, normal and reverse mode of reagent additions to obtain data for the absolute determination of sample D. O. content, and (3) measuring and correcting for certain errors in the D. O. procedure. This has resulted in a procedure with demonstrable accuracy. The improved method has a precision and accuracy which is better than plus or minus 2 ppb. (Filban-Office of Saline Water)

Descriptors: *Rock excavation, *Drilling equipment, *Tunneling machines, Thermal properties.
Identifiers: *Rock drilling, *Gas lasers, Heating equipment, Radiant heating, Cutting tools, *Heat weakening, *Heat assisted tunneling.

A study was performed to determine: (1) the increase in tunneling machine performance in hard rock resulting from heat weakening of the rock in advance of the tunneling machine, (2) the increase in hourly cost incurred by the heating system, and (3) the net effect of the increased performance and the increased hourly cost on the cost of the finished tunnel. Rock-cutting experiments were perfor on Barre granite using a 1-kw CO2-N2-He gas l for rock heating and disc-type cutters of var diameters. Analytical work included the prep tion of specific heat-assisted tunneler designs their expected performance and economics. A ternative form of using heat for tunneling was investigated in which slots were melted in the instead of merely heating it. The study concl that the operation of tunneling machines in porating lasers to provide the heat weakeni technically feasible but economically unattrac Radiant heaters have insufficient power densi effectively heat the rock, and high-temperature create serious environmental problems. How the test program indicated that a more effe way to assist mechanical cutters would be to concentrated thermal energy to melt shallow in the rock between cutter paths.

ANALYSIS OF SLOT ORIFICE FISHWAYS,
Idaho Univ., Moscow.
Purushottam Dass.
M. S. Thesis, Idaho University Graduate Sc Dec 1970. 101 p, 28 fig, 27 tab, append.

Descriptors: *Hydraulic design, *Fish pas *Hydraulic models, Hydraulics, Design, Hyd engineering, Open channel flow, Silting, Discharge (Water), Velocity, Streamflow, Hy lic structures, Weirs, Spillways.
Identifiers: Rectangular-slot fishways.

Design criteria were developed for a slot fishway. Sizing and spacing of slot orifices the fishway can be design to create flow cond satisfactory for fish passage. The slot orifice way will function well in a wide range of disch and should not have any serious silting prob Values of drag coefficients for the slot orifice strictions were evaluated by model studies range of slot openings varying from 0.6 to 0 fishway width and culvert slope varying horizontal to five percent. Nondimensional are given for the values of the drag coefficie the slot orifice constrictions and also fo backwater relations for the slot orifices. An tion, based on momentum principle, enabl designer to find the rate of flow through th way. Necessary criteria regarding suitability for fish passage are also developed. (Knapp-U

WATER RESOURCES RESEARCH INVE RY - 1969.
Department of National Development, Ca (Australia).

Australian Water Resources Council, Research and Education Steering Committ port, 1969. 212 p, 2 index.

Descriptors: *Projects, *Hydrology, resources, *Foreign research, *Research fa Laboratories, Water resources develo Groundwater, Surface waters, Meteorolog water, Sedimentation, Hydraulics, Urbanizat
Identifiers: *Australia, *Water resources res

inventory of research into water resources and ectly related matters in Australia, with brief erence to earlier work is compiled from stionnaires circulated in mid-1968, and in- des projects undertaken since 1964 or planned commence during 1968/69. Each research pro- is numbered and arranged serially, with pro- s from each institution grouped together as in- ated in the Index of Research Institutions. Sub- index terms are allotted to each project. The ti- of projects are inserted in the subject index inst the index term so that a user may review all ject titles associated with any given index term. dresses of research institutions are given in the ex of Research Institutions. The Subject Index ms are from the vocabulary of the Water ources Thesaurus published by the Office of ter Resources Research, U.S. Department of Interior, Washington, D.C., November 1966. app-USGS)

DEVELOPMENT PROGRAM
EVALUATION MODELS FOR REGIONAL DEVELOPMENT PLANNING,
W71-08277 06A

DIATOMS
PRODUCTION OF MALE GAMETES AND AUXOSPORES IN A POLYMORPH CLONE OF THE CENTRIC DIATOM CYCLOTELLA,
W71-08037 05C

DIELDRIN
EFFECTS OF DIELDRIN ON GLUTAMIC OXALOACETIC TRANSAMINASE POECILIA LATIPINNA,
W71-07733 05C

POSSIBLE METABOLITES OF DIELDRIN IN THE SAILFIN MOLLIE (POECILIA LATIPINNA),
W71-07734 05A

DIESEL OIL
OIL POLLUTION. DAMAGE OBSERVED IN TROPICAL COMMUNITIES ALONG THE ATLANTIC SEABOARD OF PANAMA,
W71-07908 05C

DIETS
FOOD NICHE AND CO-EXISTENCE IN LAKE-DWELLING TRICLADS,
W71-08033 05C

DIFFUSION
THE EFFECT OF HYDROPHOBIC SUBSTANCES ON WATER MOVEMENT I SOIL DURING INFILTRATION,
W71-08087 02G

SOIL WETTABILITY IN UTAH JUNIPER STANDS,
W71-08088 02G

DIFFUSIVITY
AN ASPIRATED DIFFUSION POROMETER,
W71-08143 02D

DIGITAL COMPUTERS
REAL-TIME COMPUTER CONTROL OF URBAN RUNOFF, (DISCUSSION
W71-07845 08B

DESIGN CONDUIT SYSTEM BY DYNAMIC PROGRAMMING,
W71-08191 08B

DILUTION POTENTIAL
DILUTION OF AN INDUSTRIAL WASTE EFFLUENT WITH RIVER WAT THE VADOSE REGION DURING PIT RECHARGE,
W71-07817 05D

DIRECTORIES
CONSERVATION DIRECTORY 1971.
W71-08236 06E

DISCHARGE MEASUREMENT
EFFECT OF SEASONAL EFFLUENT CHLORINATION ON COLIFORMS I JAMAICA BAY,
W71-07873 05F

APPLICATION OF AN ACOUSTIC STREAMFLOW-MEASURING SYSTEM THE COLUMBIA RIVER AT THE DALLES, OREGON,
W71-08056 02E

DISCHARGE(WATER)
AN AUTOMATIC OUTFLOW MEASURING DEVICE,
W71-07917 07B

COMPUTATIONS OF WATER DISCHARGES IN RIVERS FROM A BASIN WATER YIELD (RUSSIAN RASCHETY RASKHODOV VODY V REKAK VODOOTDACHE S BASSEYNA),
W71-07947 02E

OPTIMUM DESIGN OF INTERBASIN TUNNEL SYSTEMS,
W71-08198 04A

DISINFECTION
THE BACTERICIDAL EFFECT OF LIME FLOCCULATION/FLOTATION PRIMARY UNIT PROCESS IN A MULTIPLE SYSTEM FOR THE ADVA PURIFICATION OF SEWAGE WORKS EFFLUENT,
W71-07992 05D

DISPOSAL
ANIMAL WASTES,
W71-08205 05B

FARM ANIMAL-WASTE MANAGEMENT.
W71-08209 05G

CONTAMINATION OF SURFACE WATERS FROM PLOWED-IN FEEDLOT MANURE,
W71-08215 05B

DISSOLVED OXYGEN
AN EVALUATION OF THE 1968 FISH KILL IN THE DES MOINES BELOW DES MOINES,
W71-07730 05C

THE MINIMUM OXYGEN REQUIREMENTS OF FIVE SPECIES OF FIS UNDER QUIESCENT CONDITIONS,
W71-07735 05C

A COMPREHENSIVE APPRAISAL OF THE EFFECTS OF COOLING WA

SCHARGE ON AQUATIC ECOSYSTEMS,
1-08319 05C

OLVED OXYGEN ANALYZERS
VELOPMENT OF A CALIBRATION MODULE FOR TRACE OXYGEN
ALYZERS,
1-07977 08G

OLVED SOLIDS
MESTONE SOLUTION WITHIN THE EAST MENDIP AREA, SOMERSET,
1-08116 02F

ILLATION
STILLATION OF WASTE WATERS A WATER RESOURCE FOR ARID
IONS,
1-08227 05D

ILLERY WASTES
EATMENT OF DISTILLERY WASTES-A CASE HISTORY,
1-08003 05D

DRTED MODELS
E USE OF RIVER MODELS IN POWER PLANT HEAT EFFECT STUDIES,
1-08315 05B

IBUTION
LATION OF THE PHYTOPLANKTON TO TURBULENCE AND NUTRIENT
EWAL IN CASCO BAY, MAINE,
1-07889 05C

OD NICHE AND CO-EXISTENCE IN LAKE-DWELLING TRICLADS,
1-08033 05C

IBUTION PATTERNS
ISITY VARIATIONS IN ALPHINE SNOW,
1-07957 02C

IBUTION SYSTEMS
IGN CONDUIT SYSTEM BY DYNAMIC PROGRAMMING,
1-08191 08B

ICT OF COLUMBIA
RIENT DATA ON SEDIMENT SAMPLES OF THE POTOMAC ESTUARY,
